# 1 Introduction

## 1.1 Purpose

The purpose of this document is to provide an overview of the communications protocols used to control the Spectrum Pro Insert Reader, and low-level (firmware) commands that can be used to control the device when communicating (for example) via USB.

Note: ID TECH makes available a Universal SDK for the Spectrum Pro (and other ID TECH products), which hides most of the complexity of dealing with low-level calls, allowing you to create apps in a high-level language, using your favorite Integrated Development Environment. Using the Universal SDK will eliminate the need to send low-level commands and will greatly facilitate debugging. We recommend that you use the Universal SDK when developing applications that talk to the Spectrum Pro. Contact your ID TECH representative for more information.

## 1.2 Scope

This document describes the serial communication protocol between the HOST (Customer System Control Unit), the CR (the card reader: Spectrum Pro Insert Reader), and any connected PINPAD (such as ID TECH's SmartPIN L100).

## 1.3 Glossary

<b>AID</b>	Application Identifier
<b>BWT</b>	Block waiting time
<b>CBC</b>	Cipher Block Chaining
<b>CLRC</b>	Card Track Data Longitudinal Redundancy Check
<b>CR</b>	Card Reader
<b>CRIND</b>	Card Reader in Dispenser
<b>CRL</b>	Certification Revocation List
<b>CSR</b>	Certificate Signing Request
<b>DES</b>	Data Encryption Standard
<b>HOST</b>	Secure System Control Unit, the controller of Card Reader
<b>ICC</b>	Integrated Circuit Card
<b>ICCR</b>	Integrated Circuit Card Reader
<b>IV</b>	Initialization Vector
<b>LRC</b>	Longitudinal Redundancy Check
<b>LSB</b>	Least Significant Bit(s)
<b>MSB</b>	Most Significant Bit(s)

<b>PIN</b>	Personal Identification Number
<b>PCI</b>	Payment Card Industry
<b>RFU</b>	Reserved for Future Use
<b>RSA</b>	An algorithm for public-key encryption
<b>SDES</b>	Single DES
<b>SHA-256</b>	Secure Hash Algorithm 256-bit digest
<b>TDES</b>	Triple-DES (double length = 16 bits, Key3 = Key1)
<b>TDES3</b>	Triple-DES (triple length = 24 bits, three independent keys)
<b>UID</b>	Unique Identifier

#### 1.4 Abbreviations and Definitions for Line Level Communication

Symbol/Name	Description	Length	Value(s)
ETX	End of Text	1	0x03
LRC	Longitudinal Redundancy Check	1	0x00-0xff
ACK	Acknowledgement	1	0x06
NAK	Negative Acknowledgement	1	0x15
STX	Start of Text	1	0x02
TP_PACKET	Transport Data Packet	Variable	0x00-0xff

#### 1.5 Notation

The following notation is used in this document.

```

()          - Encloses Variable data
<>         - Encloses symbolic reference
""         - Encloses character literal data
[]x        - Encloses data that is encrypted with key x.
[]/x       - Encloses data that is decrypted with key x.
{}         - One or more certificates
||         - Concatenation
A<B>(C)    - Computation A done using key(s)B on data C.
<Object name>:<num><type>
    - Object size is <num> of unit <type>.
    <type> not present = bytes, 'b' = bits

```

## **2 Card Reader Communication Protocol**

All transmissions are handled by the following four protocol layers:

- Physical Layer
- Data Link Layer
- Transport Layer
- Application Layer

The physical layer defines the physical connectivity between the devices: the electrical characteristics of the communication channel and the transmitted signals such as voltage levels.

The data link layer defines how data is formatted for transmission.

The transport layer defines the frame format and transferring rules: error recognition and recovery.

The application layer defines the commands, responses and the specific data contained within each packets.

## 2.1 Physical Layer

### 2.1.1 Serial Communication Parameters

#### 2.1.1.1 UART Communication

Parameter	Specification
Transmission protocol	Asynchronous
Communication method	Full Duplex
Start bit	1 bit
Data length	8 bits (Bit7: MSB, Bit0: LSB)
Parity	None
Stop bit	1 bit
Transmission speed (Baud rate)	115200 bps (default)

The baud rate will be maintained within +2% in order to minimize data error.

#### 2.1.1.2 USB Communication

The Product ID (PID) is 0x4010.

The Vendor ID (VID) is 0xACD.

```

## 2.2 Data Link Layer

### 2.2.1 Control Word

The data link layer defines the protocol used between the HOST and the Card Reader. All data link control is accomplished by a "select" sequence. The HOST acts as the master and issues the "select sequence" to send/receive data.

Two methods of error detection are employed by this protocol to attempt to insure data integrity. An even parity check and sum check are performed on each character, and a longitudinal redundancy check (LRC) and CHECKSUM are performed to total data bits within the message block.

The LRC/CHECKSUM characters are accumulated at both the sending and receiving stations during transmission of a data block. The accumulated value is transmitted before the ETX character. The received LRC/CHECKSUM characters are compared to the locally calculated LRC/CHECKSUM characters; the two LRCs/CHECKSUMs will match exactly on a 'good' transmission. They will be different if a longitudinal error occurred. The LRC/CHECKSUM values are calculated by XORing (LRC) or adding (CHECKSUM) all data bytes that will be included in the <TP\_PACKET>. Simply XOR all bytes together, or ADD all bytes together and discard overflow (keeping just the lowest 8 bits).

The parity check, LRC, and CHECKSUM should be used in combination to insure data integrity.

The protocol allows the transmission of any data character in the range 0x00 to 0xff.

## 2.2.2 Wake Up from Low Power Mode

Spectrum Pro has various sleep and low-power modes, described hereunder.

Note that when RS-232 communication is used, the serial bus can be monitored to determine when the reader is "waking up." (It will wake up whenever a card is inserted in the slot. Hence, this wakeup can be used to help determine whether a card is being presented. You can put the unit to sleep programmatically, then listen for the wakeup.)

When Spectrum Pro wakes up, the following bytes are sent (by Spectrum Pro) over the serial bus:

```
02 05 00 67 46 51 00 00 70 fe 03
```

STX is 0x02. Payload length is 05 00. Task ID is 67. Function ID is 51. Data is 00 00. LRC is 70, checksum is FE. ETX is 0x03.

The Wakeup function is described immediately below. Run modes are described below that. (LLS = Low Leakage Stop. LLWU = Low Leakage Wake Up.)

### *Function 51 – Wakeup Signal*

#### **Output:**

<b>Result byte</b>	If the packet is correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Complete</li></ul>
<b>Task ID</b>	'67' or '27'
<b>Function ID</b>	'51'
<b>Length</b>	0
<b>Data</b>	None

**Run Mode:** Target current: 120mA  
**If card is in the slot, no low power mode is allowed.**

**Sleep Mode:** Target current: 15uA on K21 (LLS) + 30uA on NFC chip (100ms wake up mode) + 120uA on MSR Head + 6uA on UART chip at 25C. Device can be awakened by either communication or Magnetic/Contactless Card or Switches or press button.

For Magnetic and Smart Card, Front Switch and Seated Switch will wake up the device.

For Contactless, the NFC chip will enter wake-up mode, with 200ms timeout and 20us wake-up period. When the chip detects amplitude change, it will send IRQ to wake up K21 from LLS mode. From the LLWU event to power on it takes 0.3ms (K21 LLS->RUN requires 5us max., LLWU ISR requires 270us).

**Low Power Sleep Mode:** Target current: 15uA on K21 (LLS) + 30uA on NFC chip (100ms wake up mode) + 6uA on UART chip at 25C. Device can be awakened by either communication or Contactless Card or Switches or press button.

For Serial Communication, ten extra bytes (ten 0xff values) should be send out to wake up Card Reader from LLS mode (K21 LLS->RUN requires 5us max, LLWU ISR requires 270us and PLL initialization requires 270us). By sending out 0xffs on Serial port, the start bit appears as a pulse to trigger the LLWU pin interrupt, then all the other bits appears as 1 which can generate the IDLE status for Serial port. All the bytes follows 0xffs can be received by Card Reader, which is Control Package described below.

For USB Communication, device can only enter VLPS mode instead of LLS mode, this will add an extra 20uA on the K21. When there is activities on USB, it will wake up K21 from VLPS mode and K21 issues a USB rest event on the bus then starts USB enumeration. The USB enumeration takes about 5 seconds depends on the HOST.

Front Switch and Seated Switch will wake up the device.

For Contactless, the NFC chip will enter wake-up mode, with 200ms timeout and 20us wake-up period. When the chip detects amplitude change, it will send IRQ to wake up K21 from LLS mode. From the LLWU event to power on it takes 0.3ms (K21 LLS->RUN requires 5us max., LLWU ISR requires 270us).

When device is awakened by communication, K21 will enter Sleep Mode which enables card reading function. Device goes back to Stop Mode if it keeps in IDLE mode for 2 minutes. IDLE means there is no any communication and no card reading action.

**Stop Mode:** Target current: 15uA on K21 (LLS) + 5uA on NFC chip (Power-down mode) + 6uA on UART chip at 25C. Device can be awakened by either communication or Switches or press button.

For Serial Communication, ten extra bytes 0xffs should be send out to wake up Card Reader from LLS mode (K21 LLS->RUN requires 5us max., LLWU ISR requires 270us and PLL initialization requires 270us). By sending out 0xffs on Serial port, the start bit appears as a pulse to trigger the LLWU pin interrupt, then all the other bits appears as 1 which can generate the IDLE status for Serial port.

For USB Communication, device can only enter VLPS mode instead of LLS mode; this will add an extra 20uA on the K21. When there are activities on USB, it will wake up K21 from VLPS mode and K21 issues a USB rest event on the bus, then starts USB enumeration. The USB enumeration takes about 5 seconds and depends on the HOST.

Front Switch and Seated Switch will wake up the device.

For Contactless, the NFC chip will enter Power-down mode.

From the LLWU event to power on it takes 0.3ms (K21 LLS->RUN requires 5us max., LLWU ISR requires 270us).

When device is awakened by communication, K21 will enter Sleep Mode which enables card reading function. Device goes back to Stop Mode if it keeps in IDLE mode for 2 minutes. IDLE means there is no any communication and no card reading action.

**Low Power Stop Mode:** Target current: 10uA on K21 (VLLS0) + 5uA on NFC chip (Power-down mode) + 6uA on UART chip at 25C. Device can only be awakened by Switches or press button or conditional communication.

For Serial Communication, 0xff should be send out to wake up Card Reader from VLLS0 mode. By sending out 0xff on Serial port, the start bit appears as a pulse to trigger the LLWU pin interrupt, then K21 starts reset.

Front Switch and Seated Switch will wake up the device.

From the VLLS0 event to power on it takes 100ms, including reset.

**Very Low Power Stop Mode:** Target current: 10uA on K21 (VLLS0) at 25C. Device can only be awakened by Switches or press button.

Front Switch and Seated Switch will wake up the device.

From the VLLS0 event to power on it takes 100ms, including reset.

### 2.2.3 Control Package

Command and response Format:

<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX>

Note:

<LenL><LenH> is a two byte length of <TP\_PACKET>

<LRC> and <CHECKSUM> are calculated for <TP\_PACKET>

### 2.2.4 Select Sequence

Selection is used by the HOST to transmit data to the Card Reader.

The following is an example of how the select sequence is formatted:

<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX>

The Card Reader will send one of the following responses to a select sequence:

#### Example 1.1: Select sequence and received ok, Reader response received ok

HOST / READER

<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX>   —>

<—<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX>

**Example 1.2: Select sequence and received ok, Reader response received in error**

HOST / READER  
<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX> —>  
<—<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX>  
<STX><LenL><LenH><NAK><Result Byte><LRC><CHECKSUM><ETX> —  
>  
<—<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX>

**Example 2: Select sequence, received <STX> in error**

HOST / READER  
<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX> —>

**Example 3: Select sequence, received in error and retransmitted**

HOST / READER  
<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX> —>  
<— <STX><LenL><LenH><NAK><Result  
Byte><LRC><CHECKSUM><ETX>  
<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX> —>  
<—<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX>

**Example 4: Select sequence, received in error, retransmitted with “n” retries**

HOST / READER  
<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX> —>  
<— <STX><LenL><LenH><NAK><Result  
Byte><LRC><CHECKSUM><ETX>  
<STX><LenL><LenH><TP\_PACKET><LRC><CHECKSUM><ETX> —>  
<—<STX><LenL><LenH><NAK><Result Byte><LRC><CHECKSUM><ETX>

<<Sent "n" retries, see Errors and Handling>>, n is 5

Note: NAK must be sent in BWT (see Errors and Handling) when it is needed, otherwise the sender will not be able to resend the message because any data in a raw communication buffer is kept no longer than BWT.

## 2.3 Transport Layer

### 2.3.1 Format

A transport packet (TP\_PACKET) consists of a variable length data packet. The transport packet has the following format:

**Command Packet:**

Task ID	0x46 ('F')	Function ID	[Length]	[DATA]
1 byte	1 byte	1 or 2 bytes	2byte	0 to 4096 bytes

**Response Packet:**

- **If command protocol is wrong**

Data Field				
NAK	Result byte	Task ID	0x46 ('F')	Function ID
1 byte	2 byte	1 byte	1 byte	1 byte or 2 bytes

NOTE: Some commands have two bytes for the Function. The response packet will also return two bytes for Function if the original command used two bytes.

- **If command protocol is correct**

Data Field					
ACK	Task ID	0x46 ('F')	Function ID	[Length]	[DATA]
1 byte	1 byte	1 byte	1 byte or 2 bytes	2 byte	0 to 4096 bytes

For each message received from the HOST, the Card Reader must only validate the LRC before processing the message.

### 2.3.2 Data Packet

The TP\_PACKET is either directed to the transport layer or the application layer for processing. All TP\_PACKETs that begin with 0x00 thru 0xFF are to be processed by the application layer.

### 2.3.3 Length of Data

The length field in transport layer is by default formatted as: 2 byte, unsigned, little-endian: <LenL><LenH>

## 2.4 Errors and Error Handling

### 2.4.1 Link layer errors and handling

The data link layer must handle errors in such a manner that the system can recover without loss of data from errors and unexpected conditions encountered during message communication.

The following errors will be detected by the link layer:

1. BWT time-out

The maximum interval between the leading edge of the start bit of the last character that gave the right to send to the Card Reader and the leading edge of the start bit of the first character sent by the Card Reader. It is recommended that the time-out period for BWT is 500 milliseconds.

2. Wrong control symbols in some positions of STX, ETX, NAK.

3. Transmission error, including parity, LRC and CHECKSUM error

4. Message buffer overflow: Receipt of message, which is greater than the buffering capabilities of the Card Reader, will cause the Card Reader to transmit a NAK response to the message.

If any of the above errors occur, the Card Reader should not process the message and should wait for the Controller to retry the select sequence.

If any of the above errors occur in the message from a card reader, the HOST should have three times transport layer tries. If the error still happens after the tries, the transport layer should report to application layer.

#### ***2.4.2 Transport layer errors and handling***

After three tries, the transport layer should report an error to the application layer.

## 2.5 Application Layer

### 2.5.1 Task ID

From	To	K21 HUB	MSR Header	Contactless	PINPAD	CHIPCARD Reader	Host
K21 HUB		N/A	'23'	'24'	'25'	'26'	'27'
MSR Header		'32'	N/A	'34'	'35'	'36'	'37'
Contactless		'42'	'43'	N/A	'45'	'46'	'47'
PINPAD		'52'	'53'	'54'	N/A	'56'	'57'
CHIPCARD Reader		'62'	'63'	'64'	'65'	N/A	'67'
Host		'72'	'73'	'74'	'75'	'76'	N/A

### 2.5.2 Result Codes (Error Codes)

Type	Result byte	Meaning
General	'90','31'	Unknown command
	'90','32'	Wrong parameter (such as the length of the command is incorrect)
	'90','3A'	Number of retries over limit
State error	'90','40'	Invalid Manufacturing system data
	'90','41'	Not authenticated
	'90','42'	Invalid Master DUKPT Key
	'90','43'	Invalid MAC Key
	'90','44'	Reserved for future use
	'90','45'	Reserved for future use
	'90','46'	Invalid DATA DUKPT Key
	'90','47'	Invalid PIN Pairing DUKPT Key
	'90','48'	Invalid DATA Pairing DUKPT Key
	'90','49'	No nonce generated
	'90','4A'	Not ready
'90','4B'	Not Mag data	
Data error	'90','50'	Invalid Certificate
	'90','51'	Duplicate detected
	'90','52'	AT checks failed
	'90','53'	TR34 checks failed
	'90','54'	TR31 checks failed
	'90','55'	MAC checks failed
'90','56'	Firmware download failed	

Resource	'90', '60	Log is full
	'90', '61	Removal sensor unengaged
	'90', '62	Any hardware problems
Third party	'90', '70	ICC communication timeout
	'90', '71	ICC data error (such check sum error)
	'90', '72	Smart Card not powered up
ICC EMV	'F2', '00	No AID or No Application Data
	'F2', '01	No Terminal Data
	'F2', '02	Wrong TLV format
	'F2', '03	AID list is full, maxim is 16
	'F2', '04	No any CA Key
	'F2', '05	No CA Key RID
	'F2', '06	No CA Key Index
	'F2', '07	CA Key list is full, maxim is 16
	'F2', '08	Wrong CA Key hash
	'F2', '09	Wrong Transaction Command Format
	'F2', '0	Unexpected Command
	'F2', '0	No CRL
	'F2', '0	CRL list is full, maxim is 90
	'F2', '0	No amount , other amount and transaction type in Transaction Command
	'F2', '0E	Wrong CA Hash and Encryption algorithm
	'F2', '0F	No Financial Card
	'F2', '10	Invalid CRL length
	'F2', '11	ICC L2 is not in idle state
	'F2', '12	Transaction Type Error
	'F2', '13	Can't modify major bits in terminal setting
	'6C', '00	Unknown parameter in command – Protocol task ID and command are right, but length is out of the requirement.
	'6A', '0	Unsupported Command – Protocol and task ID are right, but command is
	'60', '00	Save or Config Failed / Or Read Config Error, Flash Error
	'62', '02	No TransArmor TID

## 2.6 Commands Reference

### Consolidated Command Listing (Alphabetical by Command Name)

Note that some commands are one byte; some are two bytes.

Command	Name
45	<a href="#">Activate and Deactivate Removal Sensor</a>
05 02	<a href="#">Authenticate Card and Process Transaction</a>
05 03	<a href="#">Authenticate Issuer and Process Transaction</a>
06	<a href="#">Cancel Transaction</a>
91	<a href="#">Clear Log, Manufacture</a>
0A 02	<a href="#">Clear Transaction Log</a>
42	<a href="#">Configure Card Reader</a>
B0	<a href="#">Display and Get Key</a>
81	<a href="#">Download Firmware (for K21 HUB or Maxq1050)</a>
22	<a href="#">Enter Low Power Mode</a>
30	<a href="#">Get Card Data</a>
3E	<a href="#">Get DUKPT KSN</a>
61	<a href="#">Get ICC Status</a>
27	<a href="#">Get Nonce</a>
43	<a href="#">Get Parameters</a>
21	<a href="#">Host gets CR Version, UID and Session Control</a>
60	<a href="#">Manually Lock Card and Power On Card</a>
25	<a href="#">Poll Card Reader</a>
67	<a href="#">Power Down and Remove ICC Card</a>
82	<a href="#">Program Chip (for K21 HUB or Maxq1050)</a>
31	<a href="#">Purge Card Data</a>
90	<a href="#">Read Log</a>
01 04	<a href="#">Remove All Application Data</a>
04 04	<a href="#">Remove All CA Public Key</a>
85 04	<a href="#">Remove All CRLs</a>
01 02	<a href="#">Remove Application Data</a>
04 02	<a href="#">Remove CA Public Key</a>
85 02	<a href="#">Remove CRLs</a>
02 02	<a href="#">Remove Terminal Data</a>
03 01	<a href="#">Retrieve AID List</a>
01 01	<a href="#">Retrieve Application Data</a>
04 01	<a href="#">Retrieve CA Public Key</a>
04 05	<a href="#">Retrieve CA Public Key List</a>
85 01	<a href="#">Retrieve CRLs</a>
08 01	<a href="#">Retrieve EMV L2 Version</a>
09 01	<a href="#">Retrieve Kernel Check Value</a>
08 02	<a href="#">Retrieve Kernel Version</a>
02 01	<a href="#">Retrieve Terminal Data</a>
87 01	<a href="#">Retrieve Terminal ID</a>
88 01	<a href="#">Retrieve Terminal Major Configuration</a>

07 01	<a href="#">Scripting and Retrieve Transaction Result</a>
94	<a href="#">Self Test</a>
01 03	<a href="#">Set Application Data</a>
04 03	<a href="#">Set CA Public Key</a>
85 03	<a href="#">Set CRLs</a>
02 03	<a href="#">Set Terminal Data</a>
87 03	<a href="#">Set Terminal ID</a>
88 03	<a href="#">Set Terminal Major Configuration</a>
80	<a href="#">Start Firmware Upgrade (for K21 HUB or Maxq1050)</a>
05 01	<a href="#">Start Transaction</a>
2E	<a href="#">Warm Reset</a>

### Consolidated Command Listing (Sorted by Command Number)

Command	Name
01 01	<a href="#">Retrieve Application Data</a>
01 02	<a href="#">Remove Application Data</a>
01 03	<a href="#">Set Application Data</a>
01 04	<a href="#">Remove All Application Data</a>
02 01	<a href="#">Retrieve Terminal Data</a>
02 02	<a href="#">Remove Terminal Data</a>
02 03	<a href="#">Set Terminal Data</a>
03 01	<a href="#">Retrieve AID List</a>
04 01	<a href="#">Retrieve CA Public Key</a>
04 02	<a href="#">Remove CA Public Key</a>
04 03	<a href="#">Set CA Public Key</a>
04 04	<a href="#">Remove All CA Public Key</a>
04 05	<a href="#">Retrieve CA Public Key List</a>
05 01	<a href="#">Start Transaction</a>
05 02	<a href="#">Authenticate Card and Process Transaction</a>
05 03	<a href="#">Authenticate Issuer and Process Transaction</a>
06	<a href="#">Cancel Transaction</a>
07 01	<a href="#">Scripting and Retrieve Transaction Result</a>
08 01	<a href="#">Retrieve EMV L2 Version</a>
08 02	<a href="#">Retrieve Kernel Version</a>
09 01	<a href="#">Retrieve Kernel Check Value</a>
0A 02	<a href="#">Clear Transaction Log</a>
21	<a href="#">Host gets CR Version, UID and Session Control</a>
22	<a href="#">Enter Low Power Mode</a>
25	<a href="#">Poll Card Reader</a>
27	<a href="#">Get Nonce</a>
2E	<a href="#">Warm Reset</a>
30	<a href="#">Get Card Data</a>
31	<a href="#">Purge Card Data</a>
3E	<a href="#">Get DUKPT KSN</a>
42	<a href="#">Configure Card Reader</a>

43	<a href="#">Get Parameters</a>
45	<a href="#">Activate and Deactivate Removal Sensor</a>
60	<a href="#">Manually Lock Card and Power On Card</a>
61	<a href="#">Get ICC Status</a>
67	<a href="#">Power Down and Remove ICC Card</a>
80	<a href="#">Start Firmware Upgrade (for K21 HUB or Maxq1050)</a>
81	<a href="#">Download Firmware (for K21 HUB or Maxq1050)</a>
82	<a href="#">Program Chip (for K21 HUB or Maxq1050)</a>
85 01	<a href="#">Retrieve CRLs</a>
85 02	<a href="#">Remove CRLs</a>
85 03	<a href="#">Set CRLs</a>
85 04	<a href="#">Remove All CRLs</a>

88 03	<a href="#">Set Terminal Major Configuration</a>
90	<a href="#">Read Log</a>
91	<a href="#">Clear Log, Manufacture</a>
94	<a href="#">Self Test</a>
B0	<a href="#">Display and Get Key</a>

### 2.6.1 20 – Pass-Through Mode Control

#### Description:

Puts unit in pass-through mode. This command can be issued any time.

For Pass-Through mode, SP passes all the commands to PinPad.

For non-Pass-Through mode, SP doesn't pass commands to PinPad until this command is run.

#### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	06	00	72 46 20 <LengthL><LengthH> <Data>	14	DA	03
Output Hex String: 02060072462001000114DA03						
<p>In this example:            Length of data is 01 00 and data is 01, where data can be one of:            00 – Pass-through mode OFF (default)            01 – Pass-through mode ON</p>						

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Any hardware problems</li> <li>• Wrong parameter</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'20'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.2 21 – Get CR Version, UID, and Session Control

### Description:

This command may be issued when Card Reader/PINPAD is in any state.

The Card Reader will respond with the version of the firmware and the 8-byte Unique ID (UID) installed in the device.

After Card Reader/PINPAD processes the command, it starts/ends the session for this specific HOST.

### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	13	00	76 46 21 <OverallLenL><OverallLenH> <HOSTIDLenL><HOSTIDLenH> <HOST ID> <TIMEOUTLenL><TIMEOUTLenH> <TIMEOUT>	71	75	03
<p>Output Hex String: 0213007646210e000800000102030405060702006400717503</p> <p>In this example:            Timeout is 64 00 (little-endian; 100 seconds), length of Timeout data is 02 00.            HOST ID is 0001020304050607, length of HOST ID is 08 00.            Overall data length is thus 0E 00 (2 bytes timeout data, 8 bytes HOST ID, 2 bytes each for lengths).</p> <p>Data must include:</p> <ul style="list-style-type: none"> <li>• Overall length (little-endian) means total length of data</li> <li>• Length of HOST ID portion of data in 2 bytes (little endian)</li> <li>• HOST ID (range 0x01~0xFF)</li> <li>• Length of Session Timeout for this HOST ID, in 2 bytes (little endian)</li> <li>• Session Timeout (in Seconds) for this HOST ID: Little endian. Zero means the immediate end of Session. All 0xff means never timeout.</li> </ul>						

For each HOST ID, CR/PINPAD assigns a 100kbyte (25 pages) sector in the external flash memory for key and configuration storage.

### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02		00	06 <DATA>			03

Response Hex String:

```
02d30006674621cd00080068005000191b03652700494420544543482053706563747
2756d2050726f204669726d776172652056312e30302e3039312a0049442054454348
20537065637472756d2050726f204170706c69636174696f6e2056312e30302e303937
2e004944205445434820537065637472756d50726f204861726477617265205665727
3696f6e2056312e30362e3030312d004944205445434820544d332053656375726548
65616420525332333220535020526561646572205620352e333330a000000000000000
0000000010002fb4303
```

Where DATA is:

- Length of Unique identification number (UID).
- Unique identification number (UID), 8 bytes.
- Length of firmware version.
- ANSI string "ID TECH Spectrum Pro Firmware x.yy.zzz": x-major release; yy-release version; zzz-debug version.
- Length of application version.
- ANSI string "ID TECH Spectrum Pro Application Vx.yy.zzz": x-major release; yy-release version; zzz-debug version.
- Length of MSR Header version, (Optional for Manufacture test).
- ANSI string MSR Header "ID TECH TM3 SecureHead RS232 SP Reader V x.yy": x-major release; yy-minor firmware version.
- Length of hardware version.
- Hardware version ANSI string "ID TECH SpectrumPro Hardware Version x.yy.zzz": x-major release; yy-main board version; zzz-SecureHead version.
- Length of ID TECH S/N.
- ID TECH S/N derived from UID; 10 bytes.
- Length of Symmetric or Asymmetric flag.
- Symmetric or Asymmetric flag
  - 0 - Symmetric only
  - 1- Asymmetric only
  - 2- Both Symmetric and Asymmetric

Note: Check value is using 2-byte CRC.

### 2.6.3 22 – Enter Low Power Mode (Applies to UART interface ONLY)

#### Description:

This command may be issued when CR is in any state, but requires UART interface. (For USB interface, USB Bus will control the low power mode.)

#### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	06	00	76 46 22 <LenL><LenH><Data>			03

Where:

LenL is the low byte of the length of overall data.

LenH is the high byte of the length of overall data.

Data is:

- Length of Timeout, 2 bytes
- Time out for automatically entering Low Power mode, in seconds, 1 byte.

Note: 0 for disabling automatically enter timeout.

- Length of Low power mode, 2 bytes
- Low power mode type, 1 byte:
  - 0- Normal run mode
  - 1- Low Power Sleep mode: MSR off, Contactless on, UART on, Switch on
  - 2- Stop mode: MSR off, Contactless off, UART on, Switch on
  - 3- Low Power Stop mode: MSR off, Contactless off, UART on, Switch on
  - 4- Very Low Power Stop mode: MSR off, Contactless off, UART off, Switch on

#### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02	06	00	06 67 46 22 00 00	05	D5	03

Response Hex String: 02060006674622000005d503

Success: 06 (ACK) or else Not Ready or Wrong Parameter.

## 2.6.4 23 – Host Get CR/PINPAD Version (Verbose)

### Description:

This command gets the detailed firmware version info for the unit. The command may be issued when Card Reader/PINPAD are in any state.

The Card Reader will respond with the UID (8 bytes) and version of the firmware, hardware, etc., as below.

### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	05	00	76 46 23 00 00	13	DF	03
Command Hex String: 020500764623000013DF03						

### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02	06	00	06 67 46 23 <LenL><LenH><Data>	05	D5	03
<p>Response Hex String (example): 02 27 01 06 67 46 23 21 01 08 00 39 00 50 00 2a 5c e3 65 27 00 49 44 20 54 45 43 48 20 53 70 65 63 74 72 75 6d 20 50 72 6f 20 46 69 72 6d 77 61 72 65 20 56 31 2e 30 30 2e 31 31 35 2a 00 49 44 20 54 45 43 48 20 53 70 65 63 74 72 75 6d 20 50 72 6f 20 41 70 70 6c 69 63 61 74 69 6f 6e 20 56 31 2e 30 30 2e 31 33 37 27 00 49 44 20 54 45 43 48 20 53 70 65 63 74 72 75 6d 20 50 72 6f 20 48 61 72 64 77 61 72 65 20 56 31 2e 30 36 2e 30 30 30 2d 00 49 44 20 54 45 43 48 20 54 4d 33 20 53 65 63 75 72 65 48 65 61 64 20 52 53 32 33 32 20 53 50 20 52 65 61 64 65 72 20 56 20 35 2e 33 34 35 00 49 44 20 54 45 43 48 20 53 70 65 63 74 72 75 6d 20 50 72 6f 20 41 70 70 6c 69 63 61 74 69 6f 6e 20 42 6f 6f 74 6c 6f 61 64 65 72 20 56 31 2e 30 30 2e 30 30 31 31 00 49 44 20 54 45 43 48 20 53 70 65 63 74 72 75 6d 20 50 72 6f 20 46 69 72 6d 77 61 72 65 20 42 6f 6f 74 6c 61 64 65 72 20 56 31 2e 30 30 2e 30 30 30 8a ea 03</p> <p>ASCII:            ID.TECH.Spectrum.Pro.Firmware.V1.00.115*.ID.TECH.Spectrum.Pro.Application.V1.00.137'.ID.TECH.Spectrum.Pro.Hardware.V1.06.000-.ID.TECH.TM3.SecureHead.RS232.SP.Reader.V.5.345.ID.TECH.Spectrum.Pro.App            lication.Bootloader.V1.00.0011.ID.TECH.Spectrum.Pro.Firmware.Bootlader.V1.00.000</p> <p>Success: 06 (ACK)            Error: Any hardware problems.</p>						

Length (little-endian): 21 01

Data:

- Length of Unique identification number (UID) – 8 bytes
- Unique identification number (UID), 8 bytes.
- Length of firmware version
- ANSI string "ID TECH Spectrum Pro Firmware x.yy.zzz": x-major release; yy-release version; zzz-debug version
- Length of application version
- ANSI string "ID TECH Spectrum Pro Application Vx.yy.zzz": x-major release; yy-release version; zzz-debug version

- Length of MSR Header version (Optional for Manufacture test)
- ANSI string MSR Header "ID TECH TM3 SecureHead RS232 SP Reader V x.yy": x-major release; yy-minor firmware version
- Length of application bootloader version
- ANSI string "ID TECH Spectrum Pro Application Bootloader Vx.yy.zzz": x-major release; yy-release version; zzz-debug version
- Length of firmware bootloader version
- ANSI string "ID TECH Spectrum Pro Firmware Bootloader x.yy.zzz": x-major release; yy-release version; zzz-debug version

## 2.6.5 25 – Poll Card Reader

### Description:

This command can be issued when Card Reader is in any state.

The Card Reader responds to this command with six status bytes.

After Card Reader processes the command, the state does not change.

### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	05	00	76 46 25 00 00	15	E1	03
Output Hex String: 020500764625000015e103						
Command is 76 46 25 and zero length of data: 00 00						

### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02	0C	00	06 67 46 25 <DataLenL><DataLenH><Data>	57	89	03
Response Hex String: 020c0006674625060000004034082f578903						
Where Length will generally be 06 00. Data will be the 6 data bytes (bytes 0 thru 5) discussed in the tables further below.						

### Command:

<b>Task ID</b>	'76'
<b>Function ID</b>	'25'
<b>Length</b>	0
<b>Data</b>	None

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: • Wrong parameter
<b>Task ID</b>	'67'
<b>Function ID</b>	'25'

Length	Length of data
Data	<ul style="list-style-type: none"> <li>• Byte 0: Key Status 0</li> <li>• Byte 1: Key Status 1</li> <li>• Byte 2: Tamper Status</li> <li>• Byte 3: Voltage of Backup Battery(V)</li> <li>• Byte 4: Card Status</li> <li>• Byte 5: Peripheral Status</li> </ul>

**Key Status 0 (Byte 0) is coded as shown in the following table.**

b7	b6	b5	b4	b3	b2	b1	b0	Meaning
x								MFK and RSA Key pairs are valid if set to 1
	x							Data Key valid if set to 1
		x						RKI Key valid if set to 1
			x					Device Manufacturing CA data valid if set to 1
				x				MAC Key valid if 1
					x			RFU
						x		Authenticated with Host if set to 1
							x	Device Manufacturing Secure data valid if set to 1

Note: The ‘Reader Manufacturing system data valid’ means

- All HOST static certificates have passed signature check
- ALL CR certificates including CERT\_CEK and CERT\_CSK have passed signature check
- The private keys CEKs and CSKs have passed integrity check.

**Key Status 1 (Byte 1) is coded as shown in the following table.**

b7	b6	b5	b4	b3	b2	b1	b0	Meaning
x								LCL-KEK valid if set to 1
	x							PCI Pairing valid if set to 1
		x						PIN Pairing Key valid if set to 1
			x					Data Pairing Key valid if set to 1
				x				Pinpad MAC Key valid if 1
					x			RFU
						x		Authenticated with Pinpad if set to 1
							x	RFU

**Tamper Status (Byte 2) is coded as shown in the following table:**

b7	b6	b5	b4	b3	b2	b1	b0	Meaning
x								Removal Tamper Error if set to 1
	x							Tamper Switch#2 Error if set to 1
		x						Maxq Firmware Auth Error if set to 1

x	Voltage Sensor Error if set to 1
x	Temperature Error if set to 1
x	Battery Backup Error if set to 1
x	Tamper Switch#1 Error if set to 1
x	K21 Firmware Auth Error if set to 1

Note:

- The Firmware Auth error is described in the section of Security Handling.
- The ‘Other Tamper Error’ can be used to indicate an unknown tamper, but it needs to be addressed in the log file.

**Backup Battery Status (Byte 3) is coded as shown as follows.**

0x32 : > 3.2V  
0x31 : > 3.1V  
...  
0x24 : > 2.4V  
0x23 : > 2.3V

**Card Status (Byte 4) is coded as shown in the following table:**

b7	b6	b5	b4	b3	b2	b1	b0	Meaning
x								Tamper detector active if set to 1
	x							Removal sensor active if set to 1
		x						Latch Mechanism Active if set to 1
			x					Card Present (Seated Switch) if set
				x				Removal sensor disconnected if set
					x			Card Insert (Front Switch) if set to
						x		Mag Data Present if set to 1
							x	Log is full if set to 1

Note:

- The ‘Latch Mechanism Active’ means an IC card seating, latched and powered.
- The ‘Card Present’ is set when card seated sensor is pressed.
- The ‘ICC Present’ bit indicates a card is seating and it is an IC card.
- The ‘Card Insert’ bit is set when card front sensor is pressed.
- The ‘Mag Data Present’ flag is set when card data (most likely magnetic stripe card data) is ready. When the card data has been sent to the HOST, this flag is reset.

**Peripheral Status (Byte 5) is coded as shown in the following table:**

b7	b6	b5	b4	b3	b2	b1	b0	Meaning
x								0-Maxq Manufacture FW; 1-Maxq Production
	x							0-K21 Manufacture FW; 1-K21 Production FW
		x						MSR Header connected if set to 1

x	PINPAD connected if set to 1
x	0-Test Certificates; 1-Production Certificates
x	Host connected if set to 1
x	Chip card reader available if set
x	SAM available if set to 1

**Note:**

- Reader can't detect Contactless antenna, so the Contactless available bit only indicates firmware has Contactless function or not.

## 2.6.6 27 – Get Nonce

### Description:

This command may be issued when Card Reader/PINPAD is in any state.

This command must be used just before a command (that requires NONCE values) is issued.

NONCE is active after this command and will be used in checks and calculations. Once a NONCE is used (in a check or calculation), it is NOT okay to use the same NONCE value again, as this would defeat the purpose of the NONCE. So after one side completes a command that uses a NONCE, it will reset the NONCE value to indicate there is no active NONCE value.

After this command, the state does not change.

### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	17	00	76 46 27 <DataLenL><DataLenH><NonceLenL><NonceLenH> <Nonce>	15	7D	03
Output Hex String: 02170076462712001000000102030405060708090A0B0C0D0E0F157D03  Where DataLenL, DataLenH is the little-endian overall data payload length, typically 0x12. NonceLenL, NonceLenH is the nonce length, little-endian: 10 00 (16 bytes) Nonce is 16 bytes.						

### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02	18	00	06 <Data>	46	36	03
Response Hex String: 02180006674627120010003d03d0f9870dd38da8fc0719346324be463603						

### Command:

<b>Task ID</b>	'76' or '65' or '75'
<b>Function ID</b>	'27'
<b>Length</b>	Length of data

<b>Data</b>	<ul style="list-style-type: none"> <li>• Length of NONCE</li> <li>• NONCE, HOST or CR, 16 bytes</li> </ul>
-------------	--

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> </ul>
<b>Task ID</b>	'67' or '56' or '57'
<b>Function ID</b>	'27'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length of NONCE</li> <li>• NONCE, CR or PINPAD, 16 bytes</li> </ul>

4657b297e5063ca2310ba9dc42718e6ebb4e93f9ff9658d72b51b21502197549c9b06e472cecf2467aeaa4190fbaf53505450524f30303031ec9d18bbc6738c4000eebdf303

**Command:**

<b>Task ID</b>	'76'
<b>Function ID</b>	'30'
<b>Length</b>	0
<b>Data</b>	None

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> <li>• No mag data</li> </ul>
<b>Data</b>	Card Data

The Card Data is structured according to the specification below.

- Card encoding type (80: ISO/ABA 81: AAMVA, 83: Others)
- Track status (bit 0,1,2:T1,2,3 decode, bit 3,4,5:T1,2,3 sampling, bit 6: 1-SHA256, 0-SHA1, bit7: Extend field )
- Track 1 unencrypted length (1 byte, 0 for no track1 data)
- Track 2 unencrypted length (1 byte, 0 for no track2 data)
- Track 3 unencrypted length (1 byte, 0 for no track3 data)
- Clear/masked data sent status (bit 0,1,2:T1,2,3 clear/mask data present, bit 3:0-DUKPT, bit 4:0-TDES/1-AES, bit5:0-No ICC/1-use ICC, bit 6:0-Data variant, bit 7: Maghead SN)
- Encrypted/Hash data sent status (bit 0,1,2:T1,2,3 encrypted, bit 3,4,5:T1,2,3 hash, bit6:0-no session ID, bit 7: KSN)
- Extend field-1 (bit 0:Hash-SHA256)
- Track 1 masked
- Track 2 masked
- Track 3 masked
- Track 1 encrypted (TDES2/AES-128 encrypted data)
- Track 2 encrypted (TDES2/AES-128 encrypted data)
- Track 3 encrypted (TDES2/AES-128 encrypted data)
- Track 1 hashed (32 bytes Prepending Salted-SHA256-Xor)
- Track 2 hashed (32 bytes Prepending Salted-SHA256-Xor)
- Track 3 hashed (32 bytes Prepending Salted-SHA256-Xor)
- DATA DUKPT Key KSN (10 bytes)

For further details on the MSR data output format, see ID TECH 80000502-001, *Encrypted Data Output*.

## **Notes:**

### **Track 1, Track 2 and Track 3 Unencrypted Length**

This one-byte value is the length of the original Track data. It indicates the number of bytes in the Track masked data field. It should be used to separate Track 1, Track 2 and Track 3 data after decrypting Track encrypted data field.

### **Track 1, Track 2 and Track 3 Masked**

Track data masked with '\*'. The first and last four characters in PAN can be in the clear. Account name is in clear also.

### **Track 1, Track 2 and Track 3 Encrypted**

This field is the encrypted Track data, using either TDES2-CBC with initial vector of zero. If the original data is not a multiple of 8 bytes for TDES2, the reader right pads the data with zero.

The key management scheme is DUKPT. The key used for encrypting data is the DUKPT variant Key, or Data Key. Data Key is generated by first taking the DUKPT Derived Key exclusive or'ed with 0000000000FF00000000000000FF0000 to get the resulting intermediate variant key. The left side of the intermediate variant key is then TDES2 encrypted with the entire 16-byte variant as the key. After the same steps are performed on the right side of the key, combine the two key parts to create the Data Key.

### **Encrypted Data Length**

Track 1, Track 2 and Track 3 data are encrypted as separate fields. In order to get the number of bytes for encrypted data field, we need to get Track unencrypted length first. The field length is always a multiple of 8 bytes for TDES2. This value will be zero if there was no data on both tracks or if there was an error decoding both tracks. Once the encrypted data is decrypted, all padding zeros need to be removed.

### **Track 1, Track 2 and Track 3 Hashed**

Salted-SHA-256 is used to generate hashed data for Track 1, Track 2, and Track 3 unencrypted data. It is 32 bytes long for each track.

### 2.6.8 31 – Clear Card Data

#### Description:

This command may be issued when Card Reader/PINPAD is in any state.

This command can be used to clear previous MSR Card Data from the buffer.

#### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	05	00	76 46 31 00 00	01	ED	03
Output Hex String: 020500764631000001ed03						

#### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02	06	00	06 67 46 31 00 00	16	E4	03
Response Hex String: 02060006674631000016e403						

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Complete</li><li>• Wrong parameter</li></ul>
--------------------	---

### 2.6.9 38 – PIN Pad Pairing

The Spectrum Pro is capable of pairing with ID TECH's SmartPIN L100 encrypting PIN pad, for a full chip-and-PIN solution.

Before running this command, ensure that the Spectrum Pro as well as the L100 PIN pad has been injected with a Pairing Key. For a detailed description of the pairing process, see document P/N 80141505-001, *ID TECH Spectrum Pro and SmartPIN L100 Pairing*.

The pairing command is 76 38 00 00.

#### Command:

<b>Task ID</b>	'76'
<b>Function ID</b>	'38'
<b>Length</b>	0
<b>Data</b>	None

Note: The full command string (with protocol wrapper) is:  
020500764638000008F403.

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Duplicate detected; must do command sequence again.</li><li>• TR31 checks failed</li><li>• Invalid Master DUKPT key</li><li>• Any hardware problems</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'38'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.10 2E – Warm Reset

### Description:

This command can be issued when the Card Reader is in any state.

After a card reader processes the command, the card reader will do following:

1. Card data is cleared, resetting card status bits.
2. Response data of the previous command is cleared.
3. Restart reader.

### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	05	00	76 46 2E 00 00	1E	EA	03
Output Hex String: 02050076462E00001EEA03						

### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02	06	00	06 67 46 2e 00 00	09	E1	03
Response Hex String: 0206000667462e000009e103						

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Complete</li><li>• Wrong parameter</li></ul>
<b>Length</b>	0
<b>Data</b>	None

### 2.6.11 3E – Get DUKPT KSN

This command retrieves the current Key Serial Number for the type of key queried. If the key does not exist, the command gives an error code of 0x9042.

#### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	06	00	76 46 3E 01 00 02	0D	FD	03
Output Hex String: 02060076463e0100020dfd03						

#### Command:

<b>Task ID</b>	'76'
<b>Function ID</b>	'3E'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Key Index, 1 byte</li> <li>0x2 – Data Encryption Key (DEK)</li> <li>0x5 – MAC Key (MAC)</li> <li>0xA – PCI Pairing Key (PCK), BDK for PINPAD and IPEK for Reader</li> <li>0xC – RKI Key Encryption Key (RKI-KEK)</li> <li>0x14 – LCL-KEK</li> </ul>

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Invalid Master DUKPT key</li> <li>• Any hardware problems</li> </ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'3E'
<b>Length</b>	Length of DUKPT KSN (0x0A – ten bytes)
<b>Data</b>	• DUKPT KSN

## 2.6.12 40 01 – Get TransArmor TID

### Description:

Host gets TransArmor 8 byte TransArmor TID.

### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'40','01'
<b>Length</b>	0
<b>Data</b>	None

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• No TransArmor TID</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'40', '01'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.13 40 02 – Set TransArmor TID

#### Description:

Host sets 8 bytes TransArmor TID.

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'40','02'
<b>Length</b>	Length of data
<b>Data</b>	• TID

Note:

- TID must be 8 bytes ASCII (0x20 – 0x7F).

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'40','02'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.14 40 03 – Load Certificate for TransArmor Encryption

### Description:

Load, Root CA, Intermediate CA, or TA Key Certificates.

### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'40','03'
<b>Length</b>	Length of data
<b>Data</b>	• Certificate in X.509 PEM format

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Number of retries over limit</li><li>• Invalid Certificate</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'40','03'
<b>Length</b>	0
<b>Data</b>	None

- The Certification Chain includes the following:
  - Root CA Certification
  - Intermediate CA Certification
  - TA Key Certification
- The detailed:
  - Root CA Certification is hardcoded in firmware. The **Certificate** needs to be loaded is **Intermediate CA Certificate** or **TA Key Certificate**.
  - POS software sends Key Update message requesting for Intermediate CA Certificate and it receives the Intermediate CA Certificate in the Key Update response from First Data Server. POS software passes the Intermediate CA Certificate to Card Reader. The Card Reader uses the Root CA Key to validate the Intermediate CA Certificate. After the Intermediate CA Certificate is validated, the Root CA Key extracts the Intermediate CA Key from the Intermediate CA Certificate.
  - POS software sends Key Update message requesting for TA Key Certificate and it receives the TA Key Certificate in the Key Update response from First Data Server. POS software passes the TA Key Certificate to Card Reader. The Card Reader uses the Intermediate CA Key to validate the TA Key Certificate. After the TA Key Certificate is validated, the Intermediate CA Key extracts the TA Key. The TA Key is used to encrypt the sensitive cardholder data in the TA authorization request. TA Key Certificate uses TA Key ID as Common Name.

- The more detailed:
  - If Intermediate CA Certification is loaded successfully, TA Key Certification should be erased immediately.

## 2.6.15 40 04 – Erase TransArmor Certificates

### Description:

Erase TransArmor Certificates.

### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'40', '04'
<b>Length</b>	6
<b>Data</b>	• “IDTECH” string

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'40', '04'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.16 40 05 – Get TransArmor Certificates Status

**Description:**

Get status of TransArmor Certificates.

**Command:**

<b>Task ID</b>	'72'
<b>Function ID</b>	'40','05'
<b>Length</b>	0
<b>Data</b>	• None

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: • Wrong parameter
<b>Task ID</b>	'27'
<b>Function ID</b>	'40', '05'
<b>Length</b>	1
<b>Data</b>	• TransArmor Certificates Status

TransArmor Certificates Status is shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>b0</b>	<b>Meaning</b>
X								RFU
	X							RFU
		X						RFU
			X					RFU
				X				RFU
					0			1- TA Key Certificate loaded
						0		1- Intermediate CA Certificate
							1	1- Root CA Certificate loaded

Note: Root CA Certificate is always loaded.

### 2.6.17 40 08 – Get TransArmor KeyID

**Description:**

Host gets TransArmor 11-byte KeyID.

**Command:**

<b>Task ID</b>	'72'
<b>Function ID</b>	'40','08'

<b>Length</b>	0
<b>Data</b>	None

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• No TransArmor TID</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'40', '08'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.18 42 - Configure Card Reader

### Description:

After Card Reader processes the command, the state doesn't change.

### Command:

<b>Task ID</b>	'76' or '62'
<b>Function ID</b>	'42'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length of CFG (configuration) bytes</li> <li>• Byte 0: CR Comm. CFG - baud rate</li> <li>• Byte 1: CR Op. CFG - Reader operation configuration</li> <li>• Byte 2: CR ICC CFG - Reader ICC configuration</li> <li>• Byte 3: RFU</li> <li>• Byte 4: RFU</li> </ul>

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> </ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'42'
<b>Length</b>	0
<b>Data</b>	None

CR Comm. CFG (Byte 0) is shown in the following table:

b7	b6	b5	b4	b3	b2	b1	b0	Meaning
X								RFU
	X							RFU
		X						RFU
			X					RFU
				X				RFU
					X			RFU
						0	0	19200 bps
						0	1	38400 bps
						1	0	57600 bps
						1	1	115200 bps(default setting)

CR Op. CFG (Byte 1) is shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>b0</b>	<b>Meaning</b>
X								RFU
	0	1						ICC SAM1 Enable if set to 0 1
	1	0						ICC SAM2 Enable if set to 1 0
			0					CPU card: 0 (0: default) ;
				0				EMV card: 0 (0: default) ; ISO
					1	1	1	SLE4406 SLE4436 SLE5536
					1	1	0	SLE4404 and AT88SC101
					1	0	1	GPM271 card
					1	0	0	GPM276 card
					0	1	1	SLE4442 and SLE4432 cards
					0	1	0	SLE4428 and SLE4418 cards
					0	0	1	4-byte I <sup>2</sup> C memory card
					0	0	0	3-byte I <sup>2</sup> C memory card

CR ICC CFG (Byte 2) is shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>b0</b>	<b>Meaning</b>
X								RFU
	X							RFU
		0						ICC Main 5V card: 0; 3V card: 1
			0					ICC SAM1 5V card: 0; 3V card:
				0				ICC SAM2 5V card: 0; 3V card:
					X			RFU
						X		RFU
							X	RFU

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'67' or '26'
<b>Function ID</b>	'42'
<b>Length</b>	Length of Data
<b>Data</b>	If Card Reader command checks pass, else data not present.

## 2.6.19 43 - Get Parameters

### Description:

This command can be issued at any time.

After Card Reader processes the command, the state doesn't change.

For processing details, refer to: [Process Details – Get Parameters](#)

### Command:

<b>Task ID</b>	'76'
<b>Function ID</b>	'43'
<b>Length</b>	0
<b>Data</b>	None

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'43'
<b>Length</b>	Length of data
<b>Data</b>	If Card Reader command checks pass, else data not present. <ul style="list-style-type: none"><li>• Length of CFG bytes</li><li>• Byte 0: CR Comm. CFG - baud rate</li><li>• Byte 1: CR Op. CFG - reader operation configuration</li><li>• Byte 2: CR Enc CFG - Reader encryption configuration</li><li>• Byte 3: RFU</li><li>• Byte 4: RFU</li><li>• Length of Manufacture CFG bytes</li><li>• Byte 0: Manufacture CFG</li><li>• Length RTC</li><li>• RTC, 6 bytes</li></ul>

CR Comm. CFG (Byte 0) is shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>b0</b>	<b>Meaning</b>
X								RFU
	X							RFU
		X						RFU
			X					RFU
				X				RFU
					X			RFU
						0	0	19200 bps
						0	1	38400 bps
						1	0	57600 bps
						1	1	115200 bps(default setting)

CR Op. CFG (Byte 1) is shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>b0</b>	<b>Meaning</b>
1								ICC Main Enabled if set to 1
	0	1						ICC SAM1 Enable if set to 01
	1	0						ICC SAM2 Enable if set to 10
			0					CPU card: 0 (0: default) ;
				0				EMV card: 0 (0: default) ; ISO
					1	1	1	SLE4406 SLE4436 SLE5536 and
					1	1	0	SLE4404 and AT88SC101 cards
					1	0	1	GPM271 card
					1	0	0	GPM276 card
					0	1	1	SLE4442 and SLE4432 cards
					0	1	0	SLE4428 and SLE4418 cards
					0	0	1	4-byte I <sup>2</sup> C memory card, page size
					0	0	0	3-byte I <sup>2</sup> C memory card (default),

CR Enc. CFG (Byte 2) is shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>b0</b>	<b>Meaning</b>
X								RFU
	X							RFU
		X						ICC Main 5V card: 0: 3V card: 1
			X					ICC SAM1 5V card: 0: 3V card: 1
				X				ICC SAM2 5V card: 0: 3V card: 1
					X			RFU
						X		RFU
							X	RFU

Manufacture CFG (Byte 0) is shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>b0</b>	<b>Meaning</b>
X								RFU
	X							RFU
		X						RFU
			X					RFU
				X				RFU

0	0-DUKPT(default); 1-TransAmor
X	RFU
0	0-Data variant (default); 1-PIN

Time data – 6 bytes RTC value:

- Year, one byte in BCD, 00~99
- Month, one byte in BCD, 01~12
- Day, one byte in BCD, 01~31
- Hour, one byte in BCD, 00~23
- Minute, one byte in BCD, 00~59
- Second, one byte in BCD, 00~59

## 2.6.20 44 – Read/Set MSR Settings

### Description:

This command can be issued at any time.

After Card Reader processes the command, the state doesn't change.

### Command:

<b>Task ID</b>	'73'
<b>Function ID</b>	'44'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>MSR command</li> </ul>

### Response:

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>Wrong parameter</li> <li>Any hardware problems</li> </ul>
<b>Task ID</b>	'37'
<b>Function ID</b>	'44'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>MSR response</li> </ul>

Following is a table of default setting and available settings (value within parentheses) for each function ID.

Function ID	Hex	Len	Description	Default Setting	Description	Opt	Comments
FmVerID	22	1	Firmware Version		Get firmware version string	nr	

PrePANID	49	1	PAN to not mask	4 (0-6)	# leading PAN digits to display	e	
PostPANID	4A	1	PAN to not mask	4 (0-4)	# of trailing PAN digits to display	e	
MaskCharID	4B	1	mask the PAN with this character	'*' (0x20-0x7E)	any printable character	e	
DispExpDateID,	50	1	mask or display expiration date	'0'-'1'	'1' don't mask expiration date	e	
SecureLrcID	6F	1	Secured output format Lrc option	'1' ('0'-'1')	'1' to send LRC in secured output data	e	
SecurityLevelID	7E	1	Security level	'1' ('1'-'3')	'1' no load Data encryption Key '3' has loaded Data encryption Key	nr	

Note:

- e: can be written (0x53) and read (0x52);
- nr: only can be read (0x52);
- r : can be set only one time, then always can be read (0x52);
- SecureLrcID can't be read or set when reader is configured for TransArmor.

Example:       02 09 00 73 46 44 04 00 53 49 01 06 68 A4 03  
                   02 06 00 06 37 46 44 00 00 33 C7 03  
                   Set PrePAN length to 6.

                  02 07 00 73 46 44 02 00 52 49 68 9A 03  
                   02 09 00 06 37 46 44 03 00 49 01 06 7E 1A 03  
                   Read PrePAN length.

## 2.6.21 45 – Activate and Deactivate Removal Sensor, ATed or MACed

**Note:** The HOST or PINPAD must use a dual authorized process prior to issuing this command.

### Description:

This command should be issued after the Card Reader has passed mutual authentication with PIN pad (L100 or equivalent).

There MUST be room in the log to log this event, else this command will fail.

If the removal sensor is activated and removal sensor is not engaged, Reader will see the event as tamper event and erase all the sensitive information like all established / temporal keys, PAN and PIN, and set state to unauthenticated state.

If the removal sensor is deactivated and removal sensor is not engaged, the Reader won't erase any sensitive information but it will disable any PIN related operation. The state of Reader keeps the same.

By default, card reader is at the status of deactivate removal sensor.

For processing details, refer to: [Processing Details – Activate and Deactivate Removal Sensor](#).

For command between PINPAD-CR and HOST-CR:

### Command:

<b>Task ID</b>	'76' or '56'
<b>Function ID</b>	'45'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length of Operator ID</li><li>• Operator ID</li><li>• Length of Removal Sensor control</li><li>• Removal Sensor control: Reactivate-0, Deactivate-1</li><li>• Length of Removal Sensor control timeout</li><li>• Removal Sensor control timeout, in second</li></ul> For Symmetric only PINPAD <ul style="list-style-type: none"><li>• MAC-PINPAD (Optional for manufacture mode version)</li></ul> For Asymmetric only or both PINPAD and host <ul style="list-style-type: none"><li>• Length AT-Manufacture or AT-PINPAD (Optional for manufacture mode version)</li><li>• AT-Manufacture or AT-PINPAD (Optional for manufacture mode</li></ul>

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Log is full</li> <li>• No nonce generated</li> <li>• Invalid MAC Key</li> <li>• MAC checks failed</li> <li>• Number of retries over limit</li> <li>• AT checks failed</li> <li>• Duplicate detected</li> </ul>
<b>Task ID</b>	'67' or '65'
<b>Function ID</b>	'45'
<b>Length</b>	0
<b>Data</b>	None

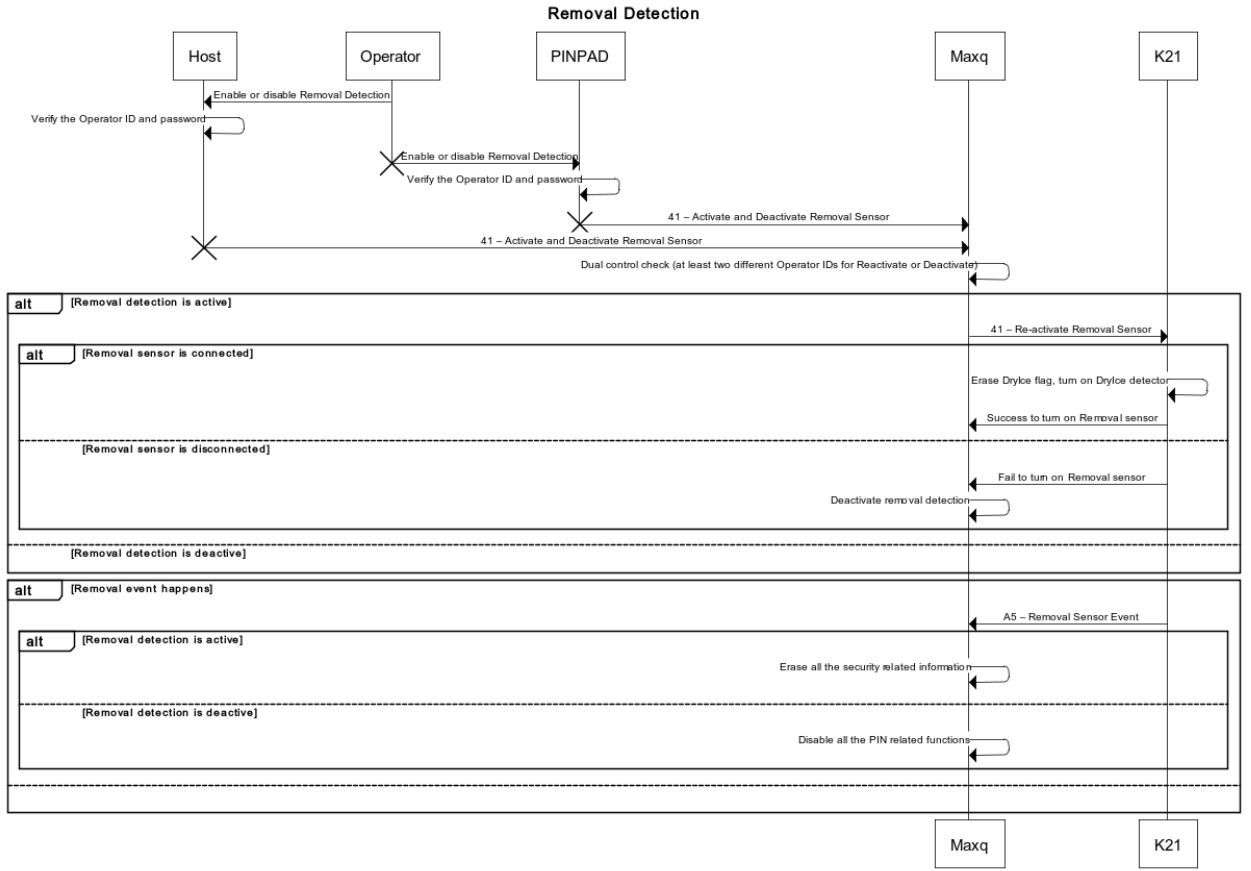

**Note:**

Operator ID is an 8-byte hexadecimal byte array. If PinPad or Host doesn't support account management (no Operator ID supported), it can send all 0 as Operator ID1 to indicate this case and UID as the Operator ID2.

Card Reader should receive at least two different Operator IDs for Reactivate or Deactivate, from dual control's concern.

Sensor control timeout: A timeout within which the dual control need to be finished. The timeout field in the 1<sup>st</sup> input of dual control is the timeout, ignore the field in the 2<sup>nd</sup> input.

# Flow Chart

www.websequencediagrams.com

## 2.6.22 46 – Activate and Deactivate Removal Sensor, ATed or MACed

**Note: The HOST must require a dual authorized process prior to issuing this command.**

### **Description:**

This command is similar to 45 (above) but uses an ICC and PIN, rather than using the SmartPIN L100 itself.

This command should be issued after the Card Reader has passed mutual authentication.

There MUST be room in the log to log this event, else this command will fail.

If the removal sensor is activated and removal sensor is not engaged, Reader will see the event as tamper event and erase all the sensitive information like all established / temporal keys, PAN and PIN, and set state to unauthenticated state.

If the removal sensor is deactivated and removal sensor is not engaged, the Reader won't erase any sensitive information but it will disable any PIN related operation. The state of Reader keeps the same.

By default, card reader is at the status of deactivate removal sensor.

For processing details, refer to: [Processing Details – Activate and Deactivate Removal Sensor](#)

For command between HOST-CR:

### **Command:**

<b>Task ID</b>	'76'
<b>Function ID</b>	'46'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length of Operator ID</li><li>• Operator ID</li><li>• Length of Removal Sensor control</li><li>• Removal Sensor control: Reactivate-0, Deactivate-1</li><li>• Length of Operator PIN</li><li>• Operator PIN, 8 bytes</li></ul> For Asymmetric only <ul style="list-style-type: none"><li>• Length AT-Manufacture or MAC (Optional for manufacture mode version)</li><li>• AT-Manufacture or MAC (Optional for manufacture mode version)</li></ul>

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Log is full</li> <li>• No nonce generated</li> <li>• Number of retries over limit</li> <li>• AT checks failed</li> <li>• Duplicate detected</li> </ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'46'
<b>Length</b>	0
<b>Data</b>	None

## Note:

Operator ID is an 8-byte hexadecimal byte array.

**The procedure for using smart card to authenticate removal control:**

- The certificate chain of Smart Card (PIVKEY C910) is loaded into SCR during manufacture.

## Note:

1. Smart Card uses Taglio RootCA and pivkey DeviceCA.
2. Smart Card requires PIN to enable security related command-signing mechanism.
3. Each Smart Card has a unique serial number. Smart Card's certificate has the information of this unique serial number.
4. Customer has a secure database which associates each Smart Card's unique serial number with its unique PIN.

## Overall Procedure:

1. The operator who is going to "turn on/off removal detector" inserts his Smart Card in the field, then sends message to customer's remote server.
2. Remote server searches its database to find the unique PIN of that smart card.
3. The 2nd operator needs to login to remote server (use his own log in credential) and verify this request. Only after the 2nd operator approves this request, remote server sends SCR secure command to enable the Smart Card validating process for "turn

on/off removal detector". This command has nonce and device ID as part of the message and signature for authentication. The Smart Card's unique PIN is also part of the message.

4. SCR receives the command, validates the signature then saves the PIN and starts verifying Smart Card.
5. SCR reads certificate of card and verifies signature against pivkey DeviceCA and taglio RootCA.
6. SCR uses the unique PIN to activate signing mechanism in Smart Card. (This is how smart card authenticates SCR)
7. SCR sends clear PKCS1.5 signature to Smart Card.
8. Smart Card uses private key to sign signature and sends back to SCR.
9. SCR uses public key from card to verify signature (This is how SCR authenticates smart card).
10. If everything passes, SCR activates or deactivates removal sensor according to command parameter. To successfully do this, the operator needs the correct card and the unique PIN.

### 2.6.23 47 – Set Force Encryption Option

**Description:** This command sets the parameter that determines encrypted output from MSR sessions. Use it to force encryption of non-financial data.

**Command:**

<b>Task ID</b>	'76'
<b>Function ID</b>	'47'
<b>Length</b>	1
<b>Data</b>	• Force encryption option byte

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: • Wrong parameter
<b>Task ID</b>	'67'
<b>Function ID</b>	'47'
<b>Length</b>	0
<b>Data</b>	None

- Bit 0 : T1 force encrypt
- Bit 1 : T2 force encrypt
- Bit 2 : T3 force encrypt
- Bit 3 : T3 force encrypt when card type is 0
- Bit 4: RFU
- Bit 5 : RFU
- Bit 6 : RFU
- Bit 7 : RFU

## 2.6.24 48 – Get Force Encryption Option

**Description:** This command allows to get the force encryption option status.

### Command:

<b>Task ID</b>	'76'
<b>Function ID</b>	'48'
<b>Length</b>	None
<b>Data</b>	None

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'47'
<b>Length</b>	1
<b>Data</b>	• Force encryption option byte

Bit 0 : T1 force encrypt  
Bit 1 : T2 force encrypt  
Bit 2 : T3 force encrypt  
Bit 3 : T3 force encrypt when card type is 80  
Bit 4: RFU  
Bit 5 : RFU  
Bit 6 : RFU  
Bit 7 : RFU

## 2.6.25 60 – Manually Lock Card and Power On Card

### Description:

This command should be issued when Card Reader in any state.

The Card Reader will send “Latch Control” command to K21-HUB which controls the latch, then Card Reader powers up the ICC. If it is successful, Card Reader should set Latch Mechanism Active flag and have no state change after processing this command.

### Command:

<b>Task ID</b>	'76' or '72' (SAM)
<b>Function ID</b>	'60'
<b>Length</b>	0
<b>Data</b>	None

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Smart Card not powered up</li></ul>
<b>Task ID</b>	'67' or '27' (SAM)
<b>Function ID</b>	'60'
<b>Length</b>	0
<b>Data</b>	None

Note: If Card Reader has latch and it couldn't successfully lock an ICC card, Card Reader should respond with 'Any hardware problems' in BWT. If Card Reader doesn't have latch, ignore the result of lock ICC card.

<b>Data</b>	<ul style="list-style-type: none"> <li>• Length of info bytes (from byte0 to last byte before ATR Data Length).</li> <li>• Byte 0: Card status</li> <li>• Byte 1: Current voltage of ICC</li> <li>• Byte 2: Current protocol use T=0 ('00') or T=1 ('01')</li> <li>• Byte 3-5: Current parameter for protocol T=0; 3 bytes (If Byte2 is T=1, all Byte3-5 is set in "0".) <ul style="list-style-type: none"> <li>Byte 3 = TA1 (FI/DI)</li> <li>Byte 4 = TC1 (Guard Time)</li> <li>Byte 5 = WI</li> </ul> </li> <li>• Byte 6 - 9: Current parameter for protocol T= 1; 4 bytes (If Byte2 is T=0, all Byte6-9 is set in "0".) <ul style="list-style-type: none"> <li>Byte 6 = TA1 (FI/DI)</li> <li>Byte 7 = TC1 (EGT)</li> <li>Byte 8 = TB3 (BWI/CWI)</li> <li>Byte 9 = IFSC</li> </ul> </li> <li>• Length of ATR Data</li> <li>• ATR Data is included when card is inserted and no other errors returned.</li> </ul>
-------------	--

The Card Presence (Byte 0) is coded as shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>Meaning</b>
0	0						RFU
		x					Latch Mechanism Active if set to 1.
			0	0			RFU
				x			Error activating/resetting ICC
					x		Error communicating with ICC
						x	Card inserted if bit is set to 1

The Current setting and Voltage of ICC (Byte 1) is coded as shown in the following table:

<b>b7</b>	<b>b6</b>	<b>b5</b>	<b>b4</b>	<b>b3</b>	<b>b2</b>	<b>b1</b>	<b>Meaning</b>
0	0	0	0	0			RFU
					0	0	The card is not powered up.
					0	1	The card is powered with 1.8 V (Not
					1	0	The card is powered with 3 V
					1	1	The card is powered with 5 V

Note: If Card Reader has latch and it couldn't successfully lock an ICC card, Card Reader will respond with 'Any hardware problems.'

## 2.6.27 ICC EMV Level II

### 2.6.27.1 CRL (Certificate Revocation List)

#### 2.6.27.1.1 85 01 – Retrieve CRLs

Command: 72 46 85 01

#### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	06	00	72 46 85 01 00 00	B0	3E	03
Output Hex String: 020600724685010000b03e03 Data: None						

#### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02			27 46 85 01 <Length> <Data>			03
<p>Response Hex String: 02070015f20b27468501090503</p> <p>(In this example, no CRL was returned, hence the error code 0xF20B: No CRL.)</p> <p>If the packet and command are correctly formed, the following status is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• Invalid CRL length</li> <li>• No CRL</li> </ul> <p>Length bytes: Length of data</p> <p>Data:</p> <ul style="list-style-type: none"> <li>• Length RevokedCertificateNDate, 2 bytes</li> <li>• RevokedCertificateNDate 1...RevokedCertificateNDate N</li> </ul> <p>Note:</p> <p>RevokedCertificateNDate format:</p> <ul style="list-style-type: none"> <li>• RID, 5 Bytes (Support at least 30 CRLs for each RID)</li> <li>• CA Index, 1 Byte</li> <li>• Certificate Serial Number of Issuer Public Key Certificate, 3 Bytes</li> </ul>						

#### 2.6.27.1.2 85 02 – Remove CRLs

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'85', '02'

<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length RevokedCertificate, 2 bytes</li> <li>• RevokedCertificate1...RevokedCertificateN</li> </ul> <p>Note: RevokedCertificate format:</p> <ul style="list-style-type: none"> <li>• RID, 5 Bytes (Support at least 30 CRLs for each RID)</li> <li>• CA Index, 1 Byte</li> <li>• Certificate Serial Number of Issuer Public Key Certificate, 3 Bytes</li> </ul>

**Response:**

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• Invalid CRL length</li> <li>• CRL list is full</li> <li>• Save or Config Failed / Or Read Config Error, Flash Error</li> <li>• Number of retries over limit</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'85', '02'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.27.1.3 85 03 – Set CRLs

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'85', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length RevokedCertificate, 2 bytes</li> <li>• RevokedCertificate1...RevokedCertificateN</li> </ul> <p>Note: RevokedCertificate format:</p> <ul style="list-style-type: none"> <li>• RID, 5 Bytes (Support at least 30 CRLs for each RID)</li> <li>• CA Index, 1 Byte</li> <li>• Certificate Serial Number of Issuer Public Key Certificate, 3 Bytes</li> </ul>

#### Response:

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• Invalid CRL length</li> <li>• CRL list is full</li> <li>• Save or Config Failed / Or Read Config Error, Flash Error</li> <li>• Number of retries over limit</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'85', '03'
<b>Length</b>	0
<b>Data</b>	None

#### 2.6.27.1.4 85 04 – Remove All CRLs

##### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'85', '04'
<b>Length</b>	Length of data
<b>Data</b>	

##### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'85', '04'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.27.2 Application Data

Each host has its specific application data. The application data needs to be loaded the first time the terminal connects to a host.

### 2.6.27.2.1 01 01 – Retrieve Application Data (Retrieve AID)

#### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	0F	00	72 46 01 01 <Length> <Data>			03
Output Hex String: 020f007246010109000700a0000000031010998d03 Length: 2 bytes, little-endian, value 5 to 16 Data: AID identifier						

#### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02	63	00	27 46 01 01 <Length> <Data>			03
Response Hex String: 02630006274601015c005a009f01065649534130305f5701005f2a0208409f09020096 5f3601029f1b0400003a98df25039f3704df28039f0802df150101df130500000000 0df1405000000000df1505000000000df180100df170400002710df190100aad803  If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• No AID or No Application Data</li> <li>• No Terminal Data</li> </ul> Data: TLVs						

### 2.6.27.2.2 01 02 – Remove Application Data

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'01', '02'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length AID</li><li>• AID, 5~16 bytes</li></ul>

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• No AID or No Application Data</li><li>• No Terminal Data• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'01', '02'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.27.2.3 01 03-Set Application Data

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'01', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length AID</li><li>• AID, 5~16 bytes</li><li>• Number of TLV</li><li>• TLV1...TLVn</li></ul>

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Wrong TLV format</li><li>• Can't modify major bits in terminal setting</li><li>• AID list is full, maxim is 16</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'01', '03'
<b>Length</b>	0
<b>Data</b>	None

#### 2.6.27.2.4 01 04 -Remove All Application Data

##### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'01', '04'
<b>Length</b>	Length of data
<b>Data</b>	

##### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'01', '04'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.27.2.5 03 01-Retrieve AID List

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'03', '01'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• No AID or No Application Data</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'03', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length AID Block</li><li>• AID Block 1...AID Block N</li></ul> <p>Note: AID Block format:</p> <ul style="list-style-type: none"><li>• Length AID</li><li>• AID, 5~16 bytes</li></ul>

### 2.6.27.3 Terminal Data

#### 2.6.27.3.1 02 01-Retrieve Terminal Data

##### Command Example

STX	Len Low	Len High	Command Body	LRC	CHK SUM	ETX
02	06	00	72 46 02 01 00 00	37	BB	03

Output Hex String: 02060072460201000037bb03

##### Response Example

STX	Len Low	Len High	Response Body	LRC	CHK SUM	ETX
02	63	00	27 46 02 01 <Length> <Data>			03

Response Hex String:

```
02cf000627460201c800c6005f3601029f1a0208409f3501259f33036008c89f4005600
0f050019f1e085465726d696e616c9f150212349f160f3030303030303030303030303
030309f1c0838373635343332319f4e2231303732312057616c6b65722053742e20437
970726573732c204341202c5553412edf260101df1008656e667265737a68df110101d
f270100dfef150101dfef160100dfef170107dfef180180dfef1e08d09c20f0c20e1400df
ee1f0180dfef1b083030303135313030dfef20013cdfef21010adfef2203323c3cfa6803
```

If the packet and command are correctly formed, the following status byte is possible:

- Complete
- Wrong parameter
- Any hardware problems
- No nonce generated
- Wait [Note]
- Number of retries over limit
- ICC communication timeout
- ICC data error
- ICC EMV Lv2 Error-No Terminal Data

Data: TLVs

### 2.6.27.3.2 02 02-Remove Terminal Data

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'02', '02'
<b>Length</b>	Length of data
<b>Data</b>	

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• No AID or No Application Data</li><li>• No Terminal Data</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'02', '02'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.27.3.3 02 03-Set Terminal Data

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'02', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Number of TLV</li><li>• TLV1...TLVn</li></ul>

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Wrong TLV format</li><li>• Can't modify major bits in terminal setting</li><li>• AID list is full, maxim is 16</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'02', '03'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.27.4 Public Key

### 2.6.27.4.1 04 01-Retrieve CA Public Key

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'04', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• RID (Registered Application Provider Identifier), 5 bytes (= first 5 bytes of AID)</li><li>• CA Index, 1 byte</li></ul>

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• No CA Key RID</li><li>• No CA Key Index</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'04', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• RID, 5 bytes</li><li>• CA Index, 1 byte</li><li>• Hash Algorithm, 1-SHA1</li><li>• Encryption Algorithm, 1-RSA</li><li>• Hash, 20 bytes</li><li>• CA Key Exponent, 4 bytes, left pad with 0</li><li>• Length CA Key Modulus</li><li>• CA Key Modulus, m bytes</li></ul> <p>Where: &lt;Hash&gt; is signature of &lt;RID&gt; &lt;CA Index&gt; &lt;CA Key Modulus&gt; &lt;CA Key Exponent&gt;</p>

#### 2.6.27.4.2 04 02-Remove CA Public Key

##### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'04', '02'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• RID, 5 bytes</li><li>• CA Index, 1 byte</li></ul>

##### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• No CA Key RID</li><li>• No CA Key Index • Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'04', '02'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.27.4.3 04 03-Set CA Public Key

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'04', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• RID, 5 bytes</li> <li>• CA Index, 1 byte</li> <li>• Hash Algorithm, 1-SHA1</li> <li>• Encryption Algorithm, 1-RSA</li> <li>• Hash, 20 bytes</li> <li>• CA Key Exponent, 4 bytes, left pad with 0</li> <li>• Length CA Key Modulus</li> <li>• CA Key Modulus, m bytes</li> </ul> <p>Where:            &lt;Hash&gt; is signature of &lt;RID&gt; &lt;CA Index&gt; &lt;CA Key Modulus&gt; &lt;CA Key Exponent&gt;</p> <p>Note:            Device supports up to 16 RID.            Each RID has up to 6 CA Index.</p>

#### Response:

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• No CA Key RID</li> <li>• No CA Key Index</li> <li>• Wrong CA Hash and Encryption algorithm</li> <li>• CA Key list is full, maxim is 16</li> <li>• Wrong CA Key hash</li> <li>• Wrong Transaction Command Format</li> <li>• Save or Config Failed / Or Read Config Error, Flash Error</li> <li>• Number of retries over limit</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'04', '03'
<b>Length</b>	0
<b>Data</b>	None

#### 2.6.27.4.4 04 04-Remove All CA Public Key

##### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'04', '04'
<b>Length</b>	Length of data
<b>Data</b>	

##### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'04', '04'
<b>Length</b>	0
<b>Data</b>	None

#### 2.6.27.4.5 04 05-Retrieve CA Public Key List

##### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'04', '05'
<b>Length</b>	0
<b>Data</b>	None

##### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• No any CA Key</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'04', '05'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length RID-Index</li><li>• RID-Index1... RID-IndexN</li></ul> <p>The format of RID-Index:</p> <ul style="list-style-type: none"><li>• RID, 5 bytes</li><li>• CA Index, 1 byte</li></ul>

## 2.6.27.5 General

### 2.6.27.5.1 08 01-Retrieve EMV L2 Version

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'08', '01'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'08', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Kernel Version</li><li>• Kernel Version, in the format of “EMVL2 X.YY”</li></ul>

### 2.6.27.5.2 08 02-Retrieve Kernel Version

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'08', '02'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'08', '02'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Kernel Version</li><li>• Kernel Version, in the format of “EMVL2 X.YY.ZZZ”</li></ul>

### 2.6.27.5.3 09 01-Retrieve Kernel Check Value

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'09', '01'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'09', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Check Value</li><li>• 20 bytes SHA-1</li></ul>

### 2.6.27.5.5 09 02-Retrieve EMV L2 Configuration Check Value

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'09', '02'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'09', '02'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Check Value</li><li>• 20 bytes SHA-1</li></ul>

### 2.6.27.5.6 87 01-Retrieve Terminal ID

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'87', '01'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• No Terminal Data</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'87', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Terminal ID</li><li>• Terminal ID, 8 bytes printable characters.</li></ul>

### 2.6.27.5.7 87 03-Set Terminal ID

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'87', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Terminal ID</li><li>• Terminal ID, 8 bytes printable characters.</li></ul>

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'87', '03'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.27.5.8 88 01-Retrieve Terminal Major Configuration

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'88', '01'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'88', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length Major Configuration</li> <li>• Terminal Major Configuration, 1 byte.</li> </ul>

Terminal Major Configuration in ICS	Values
1C	0x31
2C	0x32
3C	0x33
4C	0x34

### 2.6.27.5.9 88 03-Set Terminal Major Configuration

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'88', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length Major Configuration</li> <li>• Terminal Major Configuration, 1 byte.</li> </ul>

#### Response:

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• Save or Config Failed / Or Read Config Error, Flash Error</li> <li>• Number of retries over limit</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'88', '03'
<b>Length</b>	0
<b>Data</b>	None

Terminal Major Configuration in ICS	Values
1C	0x31
2C	0x32
3C	0x33
4C	0x34

## 2.6.27.6 Transaction

Precondition of transaction:

- Set CRL
- Set Application Data
- Set Terminal Data
- Set CA Public Key

### 2.6.27.6.1 05 01-Start Transaction (optionally MACed)

**Command:**

<b>Task ID</b>	'72'
<b>Function ID</b>	'05', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Fallback to MSR: 1Byte 1-In the case smart card transaction fails, application can fallback to MSR 0-Never fallback to MSR</li> <li>• Card Seat Time Out: 2 bytes, in seconds</li> <li>• Wait till “Authenticate Card and Process Transaction” command Time Out: 2 bytes, in seconds</li> <li>• Length Transaction Data</li> <li>• Transaction Data, TLV1...TLVn</li> </ul>

**Response:**

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• ICC L2 is not in idle state</li> <li>• Invalid DATA DUKPT Key</li> <li>• No AID or No Application Data</li> <li>• No Terminal Data</li> <li>• Wrong Transaction Command Format</li> <li>• No amount, other amount and transaction type in Transaction Command</li> <li>• Can't modify major bits in terminal setting</li> <li>• Transaction Type Error</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'05', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length Output Data</li> <li>• Length Output Data, TLV1...TLVn</li> <li>• MAC-CR(Optional)</li> </ul>

Note:

Tag 'DF EE 25' is Response Code, 2 Bytes

Note:

1).First response code format

Bit 0 --- if transaction have advice, this bit is 1.

Bit 1 --- if transaction have reversal, this bit is 1.

Tag 'DF EE 26' is Attribution: 2 Bytes:

Byte 1:

Bit 4/3/0: Captured Data Type

0 0 0 = Contact Card

0 0 1 = Contactless Card / EMV

1 0 1 = Contactless Card / MSD

0 1 x = MSR Card

Bit 2/1: Encryption Mode

0 0 = TDES

0 1 = AES

1 x = Encryption Mode Extension(Refer "Byte 2: Encryption Mode Extension")

Bit 5: Reserved for Attribution Byte Extension.

Bit 6/7: Encryption Status (For ViVOPay IDG)

0 0 = MSR/MSD off, EMV off

0 1 = MSR/MSD off, EMV on

1 0 = MSR/MSD on, EMV off

1 1 = MSR/MSD on, EMV on

Byte 2: (Optional)

Bit 3/2/1/0: Encryption Mode Extension

0 0 0 0 = TDES

0 0 0 1 = AES

0 0 1 0 = TransArmor Algorithm

0 0 1 1 = Voltage Algorithm

0 1 0 0 = Visa FPE

0 1 0 1 = Verifone FPE

0 1 1 0 = Desjardins

0 1 1 1 = RFU

1 x x x = RFU

Bit 6/5/4: Reserved

Bit 7:

0 = Without MAC Verification Data

1 = With MAC Verification Data Tag 'DF EF 1F' is auto authenticate, 2 bytes

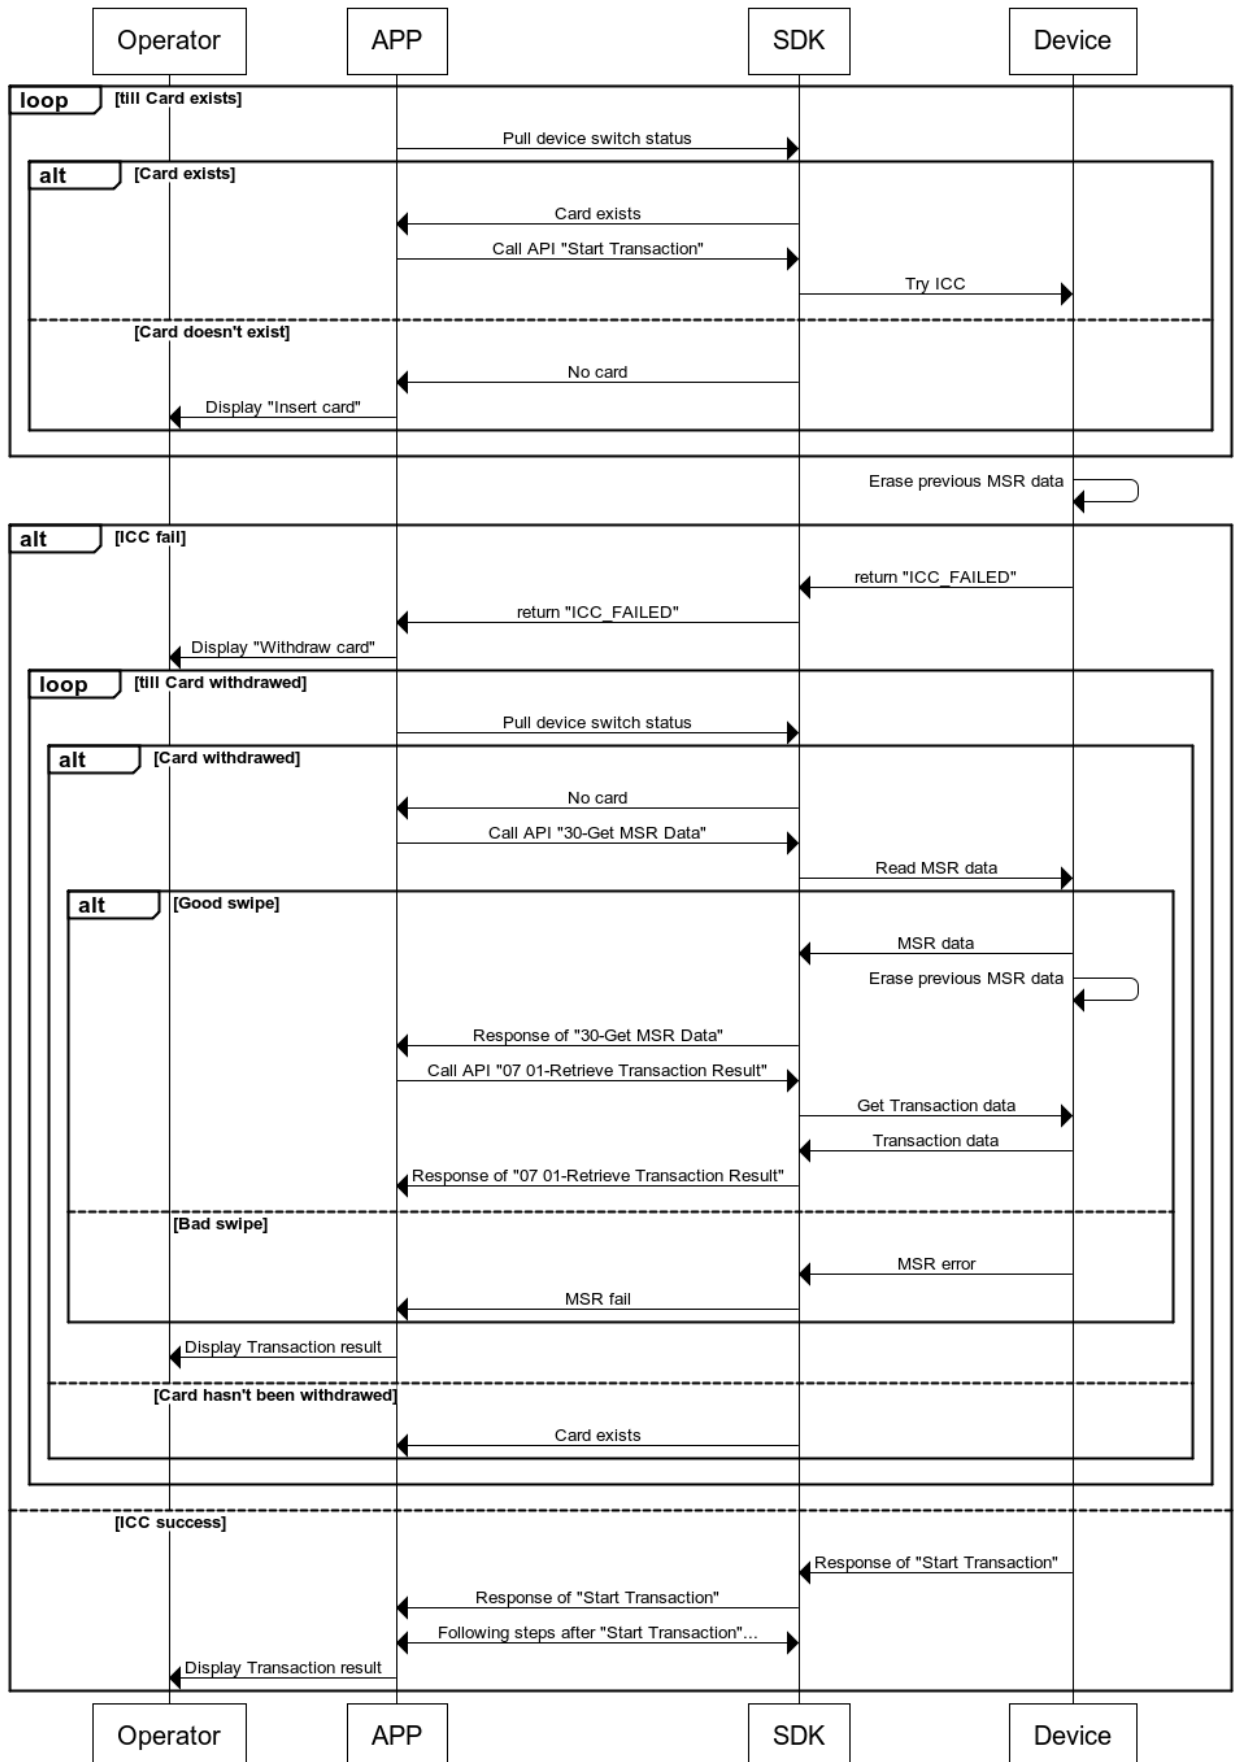

Byte 1: 1-Auto authenticate, 0-No auto authenticate

Byte 2: 1-Force online if auto authenticate, 0-Don't care

Tag 'DF EF 20' is MAC in response, 1 byte

1-MAC in response for all the Transaction commands, 0-No MAC

## Start Transaction

### 2.6.27.6.2 05 02-Authenticate Card and Process Transaction (optionally MACed)

For issuer to process online transactions, there must be verification of the data and cryptogram from the card together with data from the terminal, plus generation of a cryptogram allowing the card to authenticate the issuer. There will also be verification of online cardholder PINs as part of standard authorization processing. Issuer approves or declines a transaction in response to an online authorization request from a merchant via an acquirer.

Online authentication methods are used to validate the card to the issuer (or a representative of the issuer) and the issuer to the card as well as to prove the authenticity of received data.

With Online Card Authentication (CAM) the issuer online system validates a cryptogram (an Application Cryptogram called an ARQC) generated by the card from important transaction data using its unique secret key, to show that the card is not counterfeit and that the data has not been altered. The online request also includes card and terminal indicators of the results of offline processing.

In response to the ARQC, there is Online Issuer Authentication. The issuer optionally creates an authorization response cryptogram (ARPC). The card validates the ARPC to assure that the authorization response came unaltered from the issuer.

In addition to the ARPC described above, issuers can perform post-issuance updates of cards using issuer script commands for internal card management, such as the reset of offline counters. For example the issuer can change the Offline PIN or update a card's risk parameters. The issuer protects these script commands from undetected alteration by generating a cryptogram (MAC) from the command data. The card validates the MAC before applying the changes. Confidential data is enciphered, such as a replacement PIN value during transport between the issuer and the card.

For approved transactions the terminal sends a cryptogram (an Application Cryptogram called a TC) generated by the card with the clearing information for verification by the issuer as evidence of the validity of the completed transaction.

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'05', '02'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• ForceOnline: 1 byte 1-Force to online authorization of the transaction 0-not force to online authorization of the transaction</li><li>• Wait for host's response Time Out, if Online: 2 bytes, in second</li><li>• Length Transaction Data</li><li>• Transaction Data, TLV1...TLVn</li></ul>

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Unexpected Command</li><li>• Invalid DATA DUKPT Key</li><li>• Wrong Transaction Command Format</li><li>• Can't modify major bits in terminal setting</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'05', '02'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Output Data</li><li>• Length Output Data, TLV1...TLVn</li><li>• MAC-CR(Optional)• MAC-CR(Optional)</li></ul>

### 2.6.27.6.3 05 03-Authenticate Issuer and Process Transaction (optionally MACed)

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'05', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• OnlineProcessingAbility, 1 byte 1-able to go online 0-unable to go online</li> <li>• Authorization Response Code, Tag 8A (Optional for online)</li> <li>• Issuer Authentication Data, Tag 91 (Optional for online)</li> <li>• Issuer Scripting (generate update scripts to the card application), Tag 71/72 (Optional for online)</li> <li>• Transaction Data, TLV1...TLVn</li> </ul>

#### Response:

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• Unexpected Command</li> <li>• Invalid DATA DUKPT Key</li> <li>• Wrong Transaction Command Format</li> <li>• Can't modify major bits in terminal setting</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'05', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length Output Data</li> <li>• Length Output Data, TLV1...TLVn</li> <li>• MAC-CR(Optional)</li> </ul>

#### 2.6.27.6.4 06-Cancel Transaction

##### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'06'
<b>Length</b>	0
<b>Data</b>	None

##### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'06'
<b>Length</b>	0
<b>Data</b>	None

### 2.6.27.6.5 07 01 -- Scripting and Retrieve Transaction Result

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'07', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length Tag</li> <li>• Tag1...Tagn</li> </ul>

#### Response:

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Unknown parameter in command</li> <li>• Unsupported Command</li> <li>• Invalid DATA DUKPT Key</li> <li>• Wrong Transaction Command Format</li> </ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'07', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Length Output Data</li> <li>• Length Output Data, TLV1...TLVn, See P127, EMV4.3 book3</li> <li>• MAC-CR(Optional)</li> </ul>

### 2.6.27.6.6 0A 02 -- Clear Transaction Log

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'0A', '02'
<b>Length</b>	Length of data
<b>Data</b>	

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li><li>• Number of retries over limit</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'0A', '02'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.28 67 - Power Down and Remove ICC Card

### Description:

This command can be issued when the Card Reader is in any state, and there is no state change after processing this command.

This command powers down the Smart Card, as defined in ISO/IEC 7816-3 and allows the card to be removed by releasing the lock mechanism, and then resets Latch Mechanism Active flag.

### Command:

<b>Task ID</b>	'76', '26' or '72' (SAM)
<b>Function ID</b>	'67'
<b>Length</b>	0
<b>Data</b>	None

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li></ul>
<b>Task ID</b>	'67', '62' or '27' (SAM)
<b>Function ID</b>	'67'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.29 80 – Start Firmware Upgrade (for K21 HUB or Maxq1050)

### Description:

This command can be issued when the Card Reader is in any state and there is no state change after processing this command.

The HOST uses this command to tell the reader that a firmware download for K21 HUB or Maxq1050 is about to begin.

The Card Reader sets a 15 minute timer and is then ready to accept the first data block. If all blocks are not fully received (Download and Write commands complete) within 15 minutes, the Card Reader will reject the firmware download.

For additional details, please refer to: [Download Firmware for K21 HUB](#)

### Command:

<b>Task ID</b>	'72' or '76'
<b>Function ID</b>	'80'
<b>Length</b>	Length of data
<b>Data</b>	• Firmware header

Note:

Firmware header:

- Length firmware information
- Firmware information: string “SP K21 APP Vx.xx.xxx” or “SP MAX APP Vx.xx.xxx”, this is the name of BIN file
- Length encryption type
- Encryption type, 1byte: 0-plaintext, 1-TDES ECB, PKCS#5 padding, 2-TDES CBC, PKCS#5, IV is all 0.
- Length encrypted firmware session key blob
- Encrypted firmware session key blob, TR-31 Rev B, wrapped by FW Key (Optional, none if firmware is plaintext)
- Length size of signed encrypted firmware in bytes
- Size of signed encrypted firmware in bytes (Block# 0 signature block is included), 4 bytes

Encrypt only the file to sign and have the signature outside of the encrypted file.

The Length of the encrypted firmware is an unsigned 4-byte little-endian parameter indicating the length of the firmware including the 256 bytes signature field which locates at the beginning.

All the firmware files are signed by CA Server, using RSASSA\_PSS\_SHA256, salt setting is random. The generated 256 bytes binary file will be used as block#0.

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li></ul>
<b>Task ID</b>	'27' or '67'
<b>Function ID</b>	'80'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.30 81 – Download Firmware (for K21 HUB or Maxq1050)

### Description:

This command can be issued when the Card Reader has successfully sent ‘Start Download for K21 HUB or Maxq1050’ command and there is no state change after processing this command.

The HOST uses this command to download firmware data to the Card Reader.

For additional details, please refer to: [Download Firmware for K21 HUB](#)

### Command:

<b>Task ID</b>	'72' or '76'
<b>Function ID</b>	'81'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Download block sequence number, unsigned 2-byte little-endian, start at zero</li><li>• Length of the download block [Note]</li></ul>

Note:

- Firmware file is enciphered BIN file. The maximum size of BIN file is 1M bytes for K21 HUB and 128K bytes for Maxq. K21 HUB and Maxq firmware is saved in the external flash memory. There is a 1M bytes (256 pages) sector in the external flash memory for new firmware BIN file storage.
- Block# 0 has 256 bytes firmware signature. Signature algorithm is RSASSA\_PSS\_SHA256. Signed by manufacture public key.
- Firmware data starts from Block# 1. Length of the download block is 4k bytes if not reach the final block of firmware file. The final Block# n may not have 4k bytes data. The size of the final block is the actual bytes left, zero padding before encryption.

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Firmware download failed [Note]</li></ul>
<b>Task ID</b>	'27' or '67'
<b>Function ID</b>	'81'
<b>Length</b>	0
<b>Data</b>	None

Note: sending ‘Firmware download failed’ if the ‘Start download for K21 HUB or Maxq1050’ command has not successfully been received.

## 2.6.31 82 – Program Chip (for K21 HUB or Maxq1050)

### Description:

This command can be issued when the Card Reader is in any state.

This command becomes possible to use only after the firmware download is completed.

After CR processes this command, the Reader checks the integrity and authenticity of the downloaded firmware. If the checks pass then the reader accepts the new firmware, resets and starts executing the downloaded firmware.

### Command:

<b>Task ID</b>	'72' or '76'
<b>Function ID</b>	'82'
<b>Length</b>	0
<b>Data</b>	None

#### Note:

- For K21 HUB firmware upgrading, after receiving this command, K21-HUB will apply SHA-256 on Block# 1~n data, send those 32 bytes Hash result and Block# 0 firmware signature to Maxq in command “Validate Signature”. If the signature is valid CR replace the old K21 HUB firmware with the new one then sends back the response for “Program Chip for K21 HUB” and start using the new firmware. If the signature is invalid, K21 HUB needs to fully erase the loaded firmware file and keeps using the old firmware.
- For Maxq firmware upgrading, after receiving this command, Maxq will apply SHA-256 on Block# 1~n data, then validate those 32 bytes Hash result against Block# 0 firmware signature. If the signature is validated, the firmware data can be used to replace the existing firmware. If the signature is invalid, Maxq needs to fully erase the loaded firmware file and keeps using the old firmware.

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Firmware download failed</li><li>• Number of retries over limit</li><li>• Any hardware problems</li><li>• AT checks failed</li></ul>
<b>Task ID</b>	'27' or '67'
<b>Function ID</b>	'82'
<b>Length</b>	0
<b>Data</b>	None

**Note:** If the response can't be sent to HOST in BWT, Card Reader responds 'Wait', and then HOST keeps sending Poll command to wait for the response. The total waiting time for HOST should not be longer than 60 seconds.

### 2.6.32 84 – Retrieve Whitelist

This command retrieves any existing white list. See also functions FA and FB (elsewhere in this manual) for setting and removing whitelisted cards.

**Command:**

<b>Task ID</b>	'76'
<b>Function ID</b>	'84'
<b>Length</b>	0
<b>Data</b>	none

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Invalid Certificate</li> </ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'84'
<b>Length</b>	Length Whitelist
<b>Data</b>	<ul style="list-style-type: none"> <li>• Whitelist (No signature needed)</li> </ul>

### 2.6.33 89 01-Retrieve ICC Mask Options

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'89', '01'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'89', '01'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length of mask option</li><li>• Mask options, 5 bytes.</li></ul>

Byte 1: PrePAN, value scope is [0, 6],  
Byte 2: PosPAN, value scope is [0, 4],  
Byte 3: MaskAscii, value scope is [20h, 7Eh],  
Byte 4: MaskHex, value scope is [0Ah, 0Fh]  
Byte 5: Expire date output option,  
0x30=Mask, 0x31=NotMask, default 0x31

### 2.6.34 89 03-Set ICC Mask Options

#### Command:

<b>Task ID</b>	'72'
<b>Function ID</b>	'89', '03'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length of mask options</li><li>• Mask Options, 5 bytes</li></ul>

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Unknown parameter in command</li><li>• Unsupported Command</li><li>• Save or Config Failed / Or Read Config Error, Flash Error</li></ul>
<b>Task ID</b>	'27'
<b>Function ID</b>	'89', '03'
<b>Length</b>	0
<b>Data</b>	None

Byte 1: PrePAN, value scope is [0, 6],  
Byte 2: PosPAN, value scope is [0, 4],  
Byte 3: MaskAscii, value scope is [20h, 7Eh],  
Byte 4: MaskHex, value scope is [0Ah, 0Fh]  
Byte 5: Expire date output option,  
0x30=Mask, 0x31=NotMask, default 0x31

### 2.6.35 90 – Read Log

#### Description:

This command can be issued any time and there is no state change after processing this command.

In response to this command, CR will return all log entries

**Command:**

<b>Task ID</b>	'76'
<b>Function ID</b>	'90'
<b>Length</b>	0
<b>Data</b>	None

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'90'
<b>Length</b>	Length of data
<b>Data</b>	If Card Reader command checks pass, else data not present. <ul style="list-style-type: none"><li>• Length of binary block.</li><li>• Zero or more card reader log entries (binary block).</li></ul> See <a href="#">Log Mechanism</a> section for format of log entry.

## 2.6.36 91 – Clear Log, Manufacture (MACed)

### Description:

This command should be issued after HOST and CR have established Maintenance Certificate and have nonce exchanged. There is no state change after processing this command.

In response to this command, CR will clear all log entries.

After all log entries are cleared, a new Log Cleared entry will be added to the log.

### Command:

<b>Task ID</b>	'76'
<b>Function ID</b>	'91'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Operator Id</li><li>• Operator Id</li><li>• Length AT-Manufacture (Optional for manufacture test version)</li><li>• AT-Manufacture (Optional for manufacture test version)</li></ul>

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• No nonce generated</li><li>• Number of retries over limit</li><li>• Invalid Certificate</li><li>• AT checks failed</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'91'
<b>Length</b>	0
<b>Data</b>	None

Note: Operator ID is an 8-byte hexadecimal byte array.

### 2.6.37 94 – Self Test

#### Description:

This command is for K21-HUB or HOST to send out self-test command to CR. CR will check the firmware, certificate and whitelist.

#### Command:

<b>Task ID</b>	'76', '72' or '26'
<b>Function ID</b>	'94'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Invalid Manufacturing system data</li></ul>
<b>Task ID</b>	'67' or '62'
<b>Function ID</b>	'94'
<b>Length</b>	0
<b>Data</b>	None

Note: Event to trigger the self-test

1. Set RTC value (A2 – CR reads/writes K21 HUB RTC or RTC Event Trigger)
2. Every 23 hours (PCI requires no more than 24 hours, so we use 23 hours)

### 2.6.38 AE – Get PIN

#### Description:

For each Bank Card Data session that returns available data or card read error, the data is encrypted using DATA\_PAIRING\_DUKPT\_FUTURE\_KEY\_TABLE. CR will advance DATA\_PAIRING\_DUKPT\_KEY\_KSN and update DATA\_PAIRING\_DUKPT\_FUTURE\_KEY\_TABLE before encrypting new card data. Same as PIN\_DUKPT\_KEY and PIN\_PAIRING\_DUKPT\_KEY, PINPAD must advance PIN\_DUKPT\_KEY\_KSN or PIN\_PAIRING\_DUKPT\_KEY\_KSN and update PIN\_DUKPT\_FUTURE\_KEY\_TABLE or PIN\_PAIRING\_DUKPT\_FUTURE\_KEY\_TABLE before encrypting new PIN data.

Cancel command stops any ongoing “Get PIN” waiting. Timeouts also apply (see further below).

For Online PIN command, K21 HUB sends this command to Maxq then Maxq sends encrypted PAN to PINPAD. As a response, PINPAD encrypts PIN block (twisted with PAN) using PIN\_DUKPT\_KEY. This enciphered PIN block will be passed through Maxq and stores in K21 HUB EMV Lv2 kernel.

**Command:**

<b>Task ID</b>	'76'
<b>Function ID</b>	'AE'
<b>Example</b>	0213007646ae0e00010102001e0002003c000200454ebb6d03
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Mode byte: <ul style="list-style-type: none"> <li>- 0x00 - Cancel(cancel through command)</li> <li>- 0x01 - Online PIN DUKPT</li> <li>- 0x02 - Online PIN MKSK</li> </ul> </li> <li>• MSR PAN, 1 byte <ul style="list-style-type: none"> <li>0 – ICC PAN</li> <li>1 – MSR PAN</li> </ul> </li> <li>• If ICC PAN: Length plain text ICC PAN</li> <li>• If ICC PAN: Plain text ICC PAN</li> <li>• Length start PIN input timeout</li> <li>• Start PIN input timeout in seconds</li> <li>• Length of PIN entry interval</li> <li>• PIN entry interval in seconds</li> <li>• Length of Display Message Language (2 bytes)</li> <li>• Display Message Language, 2 byte <ul style="list-style-type: none"> <li>EN - English (default)</li> <li>ES - Spanish</li> <li>ZH - Chinese</li> <li>FR - French</li> </ul> </li> </ul>

**Response:**

<b>Result byte</b>	<p>If the packet and command are correctly formed, the following status byte is possible:</p> <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> </ul>
--------------------	--

<b>Task ID</b>	'67', '62'
<b>Function ID</b>	'AE'
<b>Length</b>	Length of data
<b>Data</b>	<p>If Mode byte is “Cancel” or “Offline PIN”, below info not applicable. If Mode byte is “Online PIN”, below fields appear:</p> <ul style="list-style-type: none"> <li>▪ Mode byte: <ul style="list-style-type: none"> <li>- 0x00 - Cancel (Can be cancel through command or user presses cancel key on the key pad)</li> <li>- 0x01 - Online PIN DUKPT</li> <li>- 0x02 - Online PIN MKSK</li> <li>- 0x03 - Offline PIN</li> </ul> </li> <li>▪ If Online PIN DUKPT, Length of PIN_DUKPT_KEY KSN</li> <li>▪ If Online PIN DUKPT, PIN_DUKPT_KEY KSN</li> <li>▪ Length Enciphered PIN</li> <li>▪ Enciphered PIN</li> </ul>

All the timeout values are little-endian.

180 seconds is timeout for starting PIN input. Once PIN input starts, 20 seconds is timeout for finishing PIN input.

### **2.6.39 B0 – Display and Get Key**

#### **Description:**

This command should be issued after CR and PINPAD/HOST have established MAC Key and there is no state change after processing this command.

In response to this command, PINPAD/HOST will control its display.

#### **Command:**

<b>Task ID</b>	'25' or '27'
<b>Function ID</b>	'B0'
<b>Length</b>	Length of data

<b>Data</b>	<ul style="list-style-type: none"> <li>• Display mode <ul style="list-style-type: none"> <li>1- Menu Display</li> <li>2- Normal Display get function key</li> <li>3- Display without key input</li> <li>8- Language Menu Display</li> <li>16- Clear Screen (Do Not Receive Input Data)</li> </ul> </li>   <li>• If Normal Display or Menu Display, Length of Total timeout for keypad entry.</li> <li>• If Normal Display or Menu Display, Total timeout for keypad entry, in second, little endian, default is 30 seconds.</li> <li>Note: Total timeout will cancel keypad entry and return error.</li>   <li>• If Normal Display or Menu Display, Length of minor timeout during each keypad entry</li> <li>• If Normal Display or Menu Display, minor timeout during each keypad entry, in second, little endian, default is 10 seconds.</li> <li>Note: Minor timeout will erase all previous keypad entry.</li>   <li>• Length Display Message Language</li> <li>• Display Message Language, 2 byte <ul style="list-style-type: none"> <li>EN - English (default)</li> <li>ES - Spanish</li> <li>ZH - Chinese</li> <li>FR - French</li> </ul> </li>   <li>• Length Display Message Control (0-No Message display)</li> <li>• Display Message Control: repeatable combination of &lt;Line&gt;&lt;Message&gt;&lt;0x1C&gt;</li> <li>&lt;Line&gt; - Display line number (1-First Line, n-nth Line), Maximum 16 lines.</li> <li>The lower 7 bits is for line number. The MSB is to indicate following message is a Message String or Message ID.</li> <li>MSB – 0: Message String.</li> <li>MSR – 1: Message ID.</li> <li>&lt;Message&gt; - Message String or Message ID.</li> <li>Message String: character in the range of 0x20 – 0x7f, Maximum 16 characters</li> <li>Note: For “Language Menu Display”, external display should extend the Message String to full string. For example:</li> <li>EN – English</li> <li>ES – Espanol</li> <li>ZH – 中文</li> <li>FR - Francis</li>   <li>Message ID: 1 byte, check <a href="#">Foreign Language Mapping Table</a></li> <li>&lt;0x1C&gt; - separator</li>   <li>• Length Back Light On TimerValue, 2 bytes</li> <li>• Back Light On TimerValue in second, little endian (all 0-Back Light Off, all 0xff-Back Light always On)</li>   <li>• Mask the keypad entry with ‘*’, 1 byte</li> <li>0 - Don’t mask</li> <li>1 - Mask</li> <li>Note: The flag works for “Normal Display get account number” and “Normal Display get numeric key”.</li> </ul>
-------------	--

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"> <li>• Wrong parameter</li> <li>• Any hardware problems</li> </ul>
<b>Task ID</b>	'52' or '72'
<b>Function ID</b>	'B0'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"> <li>• Display mode <ul style="list-style-type: none"> <li>0- Cancel (user presses cancel key on the key pad for mode 1, 4 and 5)</li> <li>1- Menu Display</li> <li>2- Normal Display get function key</li> <li>3- Display without key input</li> <li>8- Language Menu Display</li> <li>16- Clear Screen (Do Not Receive Input Data)</li> </ul> </li> </ul> <p>If Mode byte is “Cancel”, don’t need to send below field, but MAC is required.</p> <ul style="list-style-type: none"> <li>• If Normal Display, Length of Key (for function key, length is 1)</li> <li>• If Normal Display, Key0...KeyN, ASCII format</li> <li>• If Menu Display, Length of Menu value</li> <li>• If Menu Display, Menu value, sequence number of selected line, hex format</li> </ul>

**Note:**

When display message has more characters than the screen can support, use F1 key as page up and F2 key as page down.

Function Key Value, ASCII of the 1<sup>st</sup> character:

Cancel: 0x43  
Backspace: 0x42  
Enter: 0x45  
#: 0x23  
\*: 0x2A  
F1 (pg up): 0x46  
F2 (pg dn): 0x47  
F3: 0x48

## 2.6.40 D1 – Set Session Key

### Description:

Load Session Keys into device.

### Command:

<b>Task ID</b>	'78'
<b>Function ID</b>	'D1'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length of Session Key type</li><li>• Session Key type</li><li>• Length of Session Key</li><li>• Session Key</li><li>• Length of check digits</li><li>• Check digits</li></ul>

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Any hardware problems</li><li>• Invalid Master DUKPT Key</li><li>• Invalid Data DUKPT Key</li><li>• Invalid MAC DUKPT Key</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'D1'
<b>Length</b>	0
<b>Data</b>	<ul style="list-style-type: none"><li>• None</li></ul>

### Key Type

0 – Data

1 – MAC

Session Key (16 bytes) and check digits (2 bytes) are in hexadecimal. Session Key is encrypted with Master Key. The check digits are from the clear Session Key.

### 2.6.41 D3 – Generate MAC for Host

#### Description:

Generate TDES CBC MAC for host with MAC session key.

#### Command:

<b>Task ID</b>	'78'
<b>Function ID</b>	'D3'
<b>Length</b>	Length of input stream
<b>Data</b>	• Input stream

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Invalid MAC DUKPT Key</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'D3'
<b>Length</b>	Length of data
<b>Data</b>	• MAC data

Input stream is in ASCII. Use symbol 0xC0, 0xD0 for clear track 2 data in input stream.

Example:

Input Stream: 31311C393138C0D04511

Track 2:

3B353135303731303230303130373936303D3039303931303134303030303335353F

Input Stream to be MAC-hashed:

31311C3931383B353135303731303230303130373936303D3039303931303134303030303335353F4511

MAC data is 8 bytes.

The algorithm is defined in ISO 16609 as TDES CBC MAC.

### 2.6.42 D4 – Get Key ID

#### Description:

Get Key ID associated with a Master Key set.

#### Command:

<b>Task ID</b>	'78'
<b>Function ID</b>	'D4'
<b>Length</b>	0
<b>Data</b>	None

#### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• Duplicate detected</li></ul>
<b>Task ID</b>	'78'
<b>Function ID</b>	'D4'
<b>Length</b>	Length of Key ID
<b>Data</b>	• Key ID

Key ID is 8 bytes alphanumeric.

## 2.6.43 FA – Load Secure Data (Whitelist), ATed or MACed

### Description:

This command normally requires Card Reader be under “Manufacture” status, and “Load Certificate from CA Server” is already done. Because the command is secure, it must use a MAC hash conforming to the HMAC standard. Use the Universal SDK or UDemo app, as applicable, to issue this command.

### Command:

<b>Task ID</b>	'76'
<b>Function ID</b>	'FA'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• Length Whitelist ASN.1 BLK</li><li>• Whitelist ASN.1 BLK (Optional)</li><li>• MAC-Host or AT-Host</li></ul>

Whitelist ASN.1 structure ::= Sequence

```
{
  Whitelist ASN.1 structure version = 1 (INTEGER)
  BIN Exclusion ::= Set
  {
    bininfo ::= Sequence
    {
      binSetName = (PRINTABLESTRING) -- 0 if no name
      binLow = (INTEGER) -- bin >= binLow
      binHigh = (INTEGER) -- bin <= binHigh
    }
  }
}
```

Example:

```
3072020101316D300C1300020304B499020304B499300C13000203092A490203092A
49300C13000203092BE00203092BE0300C13000203097DCA0203097DCB300C1300
0203099C630203099C63300C130002030BDDE402030BDE473017130B436F6D6F74
61204361726402030ACC1002030ACC73
```

Example for Implementation in firmware/software:

```
static const unsigned int whitelist_Table[][2] = { // "g*", "T7*" for JIS II
    // binLow          binHigh          Range
    {707600,          707699}, // [707600, 707699] or 7076, Comota card
    {777700,          777799}, // [777700, 777799] or 7077, Jack in the box
    {622026,          622027}, // [622026, 622027], Metropolitan card
    {308377,          308377}, // 308377 only, Metropolitan card
    {600649,          600649}, // 600649 only, ValueLink gift card
    {601056,          601056}, // 601056 only, SVS Gift Card, new
    ValueLink card
    {629859,          629859}, // 629859 only, Transaction Resources Inc
    Gift Card
    {0,               0} // end
};
```

**Response:**

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• No nonce generated</li><li>• Number of retries over limit</li><li>• Invalid MAC Key</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'FA'
<b>Length</b>	0
<b>Data</b>	None

## 2.6.44 FB – Remove White List, ATed or MACed

### Description:

This command removes this White List.

### Command:

<b>Task ID</b>	'76'
<b>Function ID</b>	'FB'
<b>Length</b>	Length of data
<b>Data</b>	<ul style="list-style-type: none"><li>• MAC-Host or AT-Host</li></ul>

### Response:

<b>Result byte</b>	If the packet and command are correctly formed, the following status byte is possible: <ul style="list-style-type: none"><li>• Wrong parameter</li><li>• No nonce generated</li><li>• Number of retries over limit</li><li>• Invalid MAC Key</li></ul>
<b>Task ID</b>	'67'
<b>Function ID</b>	'FB'
<b>Length</b>	0
<b>Data</b>	None

<p><b>Data</b></p>	<ul style="list-style-type: none"> <li>• Display mode <ul style="list-style-type: none"> <li>1- Menu Display</li> <li>2- Normal Display get function key</li> <li>3- Display without key input</li> <li>8- Language Menu Display</li> <li>16- Clear Screen (Do Not Receive Input Data)</li> </ul> </li>   <li>• If Normal Display or Menu Display, Length of Total timeout for keypad entry.</li> <li>• If Normal Display or Menu Display, Total timeout for keypad entry, in second, little endian, default is 30 seconds. Note: Total timeout will cancel keypad entry and return error.</li>   <li>• If Normal Display or Menu Display, Length of minor timeout during each keypad entry</li> <li>• If Normal Display or Menu Display, minor timeout during each keypad entry, in second, little endian, default is 10 seconds. Note: Minor timeout will erase all previous keypad entry.</li>   <li>• Length Display Message Language</li> <li>• Display Message Language, 2 byte <ul style="list-style-type: none"> <li>EN - English (default)</li> <li>ES - Spanish</li> <li>ZH - Chinese</li> <li>FR - French</li> </ul> </li>   <li>• Length Display Message Control (0-No Message display)</li> <li>• Display Message Control: repeatable combination of &lt;Line&gt;&lt;Message&gt;&lt;0x1C&gt; &lt;Line&gt; - Display line number (1-First Line, n-n<sup>th</sup> Line), Maximum 16 lines. The lower 7 bits is for line number. The MSB is to indicate following message is a Message String or Message ID. MSB – 0: Message String. MSR – 1: Message ID. &lt;Message&gt; - Message String or Message ID. Message String: character in the range of 0x20 – 0x7f, Maximum 16 characters Note: For “Language Menu Display”, external display should extend the Message String to full string. For example: EN – English ES – Espanol ZH – 中文 FR - Francis</li>   <li>Message ID: 1 byte, check <a href="#">Foreign Language Mapping Table</a> &lt;0x1C&gt; - separator</li>   <li>• Length Back Light On TimerValue, 2 bytes</li> <li>• Back Light On TimerValue in second, little endian (all 0-Back Light Off, all 0xff-Back Light always On)</li>   <li>• Mask the keypad entry with ‘*’, 1 byte</li> </ul>
--------------------	---

## 3 Application Notes

### 3.1 Algorithms

#### 3.1.1 Nonce

The nonce is a one-time/single-use token that helps to secure the command and message. Based on PCI spec of HSM, the nonce should be ensured to be 'sufficiently unpredictable' to against the test of NIST SP 800-22. The purpose of the nonce is to prevent replay attacks.

#### 3.1.2 Padding

Padding format is defined in TR-31, but no specification exists to define how to generate it. Therefore we use here the padding format defined in TR-31 and the generation mechanism of OAEP introduced in ANS X9F1.

**PKCS#5 Padding:** PKCS5Padding follows the following rules:

- The number of bytes to be padded must equal "8 - numberOfBytes(clearText) mod 8". So 1 to 8 bytes will be added to the clear text data depending on the length of the clear text data.
- All padded bytes have the same value: the number of bytes padded.

Thus, for example, if M is the original clear text and PM is the padded clear text:

If numberOfBytes(clearText) mod 8 == 7, PM = M + 0x01

If numberOfBytes(clearText) mod 8 == 6, PM = M + 0x0202

If numberOfBytes(clearText) mod 8 == 5, PM = M + 0x030303

...

If numberOfBytes(clearText) mod 8 == 0, PM = M + 0x0808080808080808

#### 3.1.3 SHA256

Use SHA-256 to calculate any hash result.

#### 3.1.4 HMAC

Use HMAC-SHA256 (Refer to RFC2104), retaining only the left-most (high order) **16 bytes** of the calculation for MAC Authentication.

$$HMAC(K, m) = H((K \oplus opad) | H((K \oplus ipad) | m))$$

Where

H is a cryptographic hash function (SHA256),

K is a secret key, padded to the right with extra zeros to the input block size of the hash function, or the hash of the original key if it's longer than that block size,

Secret key is the MAC key both-way variant, derived from MAC\_DUKPT\_BDK

m is the message to be authenticated,

| denotes concatenation,

$\oplus$  denotes XOR,

opad is the outer padding (0x5c5c5c...5c5c, one-block-long hexadecimal constant),

ipad is the inner padding (0x363636...3636, one-block-long hexadecimal constant).

The final HMAC value consists of the first 16 bytes of the overall hash.

### **3.1.5 SIGN**

Use 2048-bits RSASSA\_PSS\_SHA256 for signature calculation.

### **3.1.6 RSA ENCRYPT**

Use 2048-bits RSA\_OAEP for asymmetric key encryption.

## 3.2 Computations

### 3.2.1 AT-Manufacture

The token used to authenticate messages sent from Vendor.

This computation is used when vendor wants to load secure information to device.

AT-Manufacture = RSASSA\_PSS\_SHA256<DMKs>(CR\_NONCE || CR\_UID || msgX)

The AT-Manufacture will be the last field in a message and msgX will be 1<sup>st</sup> byte of message being built (TPPACKET.InstructionCode) up to (but not including) the AT-Manufacture 1<sup>st</sup> byte.

Note: There is no CR\_NONCE || CR\_UCI required because this message is generated for all the devices.

### 3.2.2 AT-HOST

The token used to authenticate messages sent from HOST to CR.

This computation is slower than MAC-HOST and will be used until MAC-HOST is established.

AT-HOST = RSASSA\_PSS\_SHA256<HSKs>(CR\_NONCE || CR\_UID || msgX)

The AT-HOST will be the last field in a message and msgX will be 1<sup>st</sup> byte of message being built (TPPACKET.InstructionCode) up to (but not including) the AT-HOST 1<sup>st</sup> byte.

### 3.2.3 AT-CR

The token used to authenticate messages sent from CR to HOST or from CR to PINPAD.

This computation is slower than MAC-CR and will be used until MAC-CR is established.

AT-CR = RSASSA\_PSS\_SHA256<CSKs>(HOST\_NONCE || HOST\_ID || msgX)

or

AT-CR = RSASSA\_PSS\_SHA256<CSKs>(PINPAD\_NONCE || PINPAD\_UID || msgX)

The AT-CR will be the last field in a message and msgX will be 1<sup>st</sup> byte of message being built (TPPACKET.InstructionCode) up to (but not including) the AT-CR 1<sup>st</sup> byte.

### **3.2.4 MAC-HOST**

The HMAC result used to authenticate messages sent from HOST to CR.

$$\text{MAC-HOST} = 2\text{bytes length\_MAC} + \text{HMAC}\langle\text{MAC\_DUKPT\_KEY}\rangle(\text{CR\_NONCE} \parallel \text{CR\_UID} \parallel \text{msgX}) + 2\text{bytes length\_KSN} + \text{MAC\_DUKPT\_KEY\_KSN}$$

The MAC-HOST will be the last field in a message and msgX will be 1<sup>st</sup> byte of message being built (TPPACKET.InstructionCode) up to (but not including) the MAC-HOST 1<sup>st</sup> byte.

Advancing KSN is controlled by Host.

### **3.2.5 MAC-CR**

The HMAC result used to authenticate messages sent from CR to HOST:

$$\text{MAC-CR} = 2\text{bytes length\_MAC} + \text{HMAC}\langle\text{MAC\_DUKPT\_KEY1}\rangle(\text{HOST\_NONCE} \parallel \text{HOST\_ID} \parallel \text{msgX}) + 2\text{bytes length\_KSN} + \text{MAC\_DUKPT\_KEY1\_KSN}$$

Or from CR to PINPAD:

$$\text{MAC-CR} = 2\text{bytes length\_MAC} + \text{HMAC}\langle\text{MAC\_DUKPT\_KEY2}\rangle(\text{PINPAD\_NONCE} \parallel \text{PINPAD\_UID} \parallel \text{msgX}) + 2\text{bytes length\_KSN} + \text{MAC\_DUKPT\_KEY2\_KSN}$$

The MAC-CR will be the last field in a message and msgX will be 1<sup>st</sup> byte of message being built (TPPACKET.InstructionCode) up to (but not including) the MAC-CR 1<sup>st</sup> byte.

In the CR-PINPAD communication, advancing KSN is controlled by CR.

### 3.3 Log Mechanism

A log mechanism will enable the recording of certain card reader events which are required by the latest release of PCI. The log creation, storing, clearing and reading follow the latest PCI requirements.

The events include security events, such as

- Removal sensor flag just on
- Removal sensor flag just cleared
- Log records just cleared
- Manufacture system data just loaded
- Firmware downloading
- Root CA erased
- Root CA loaded

And tamper events, such as

- Tamper events just occurred
- Tamper events just disappeared.

Log mechanism properties:

1. Log entries stored in reader non-volatile memory.
2. Log entry contents (size 16 bytes):

- a. DateTime – Date and time of event.

Format: 6-byte

-Year, one byte in BCD, 00~99

-Month, one byte in BCD, 01~12

-Day, one byte in BCD, 01~31

-Hour, one byte in BCD, 00~23

-Minute, one byte in BCD, 00~59

-Second, one byte in BCD, 00~59s

- b. OperatorID – Operator ID/Host ID of entity that caused the logged event.

Format: 8 bytes

All 0x00 – Card reader caused event:

Can only be used by card reader caused events

Ex: Removal flag change: cleared -> set

Else – ID of operator that caused event (passed in HOST command).

- c. EventType – Event type.

Format: 2 bytes, as [Byte 0], [Byte 1]

Byte 0: Event Class:

0x01 – Security event

0x02 – Tamper event

Byte 1: Event Type:

1) Security Events:

- a. 0x01 – Log cleared.

- b. 0x02 – Removal sensor flag changed: set to cleared
  - c. 0x03 – Removal sensor flag changed: cleared to set
  - d. 0x04 – Manufacturer system data just loaded
  - e. 0x05 – New Maxq firmware being written
  - f. 0x06 – New K21 firmware being written
  - g. 0x07 – Root CA reload with signed root
- 2) Tamper event
- a. Mirrors Tamper Status Byte in the response to Poll Card Reader command.
  - b. If the ‘other tamper flag’ is on, short information can be stored in the OperatorID field.
3. Must be readable (requires authentication).
4. Must be resettable (requires authentication).

Operational notes:

- 1. If the log is full, then certain card reader operations will be disabled (ex: Clear Removal Sensor).
- 2. The reader can keep at least 290 log records.

## 3.4 Download Firmware

### 3.4.1 Start Download

After receiving this command, timing should begin a download session for a maximum 15 minutes of download time. A flag is set to indicate firmware is ready for download.

### 3.4.2 Download Firmware

- Download ready flag should be checked at the beginning to make sure the previous step is finished, if flag is not set, return error message.
- If flag is set, copy firmware to the external flash memory.
- Firmware is copied to external flash memory by blocks. The first block is consist of 256 bytes firmware signature and starting from second block, firmware is divided into many 4k blocks, remainder bytes left are copied in the last block. 4k flash storage is assigned for each block (including the first and last), and each of them are erased before copying.
- A flag should set after saving/copying the new firmware to indicate firmware is ready for write.

### 3.4.3 Write Firmware

- "Download complete" flag from previous step should be checked; if flag is not set, return error message.
- If flag is set, 32 bytes of HASH is calculated from the downloaded firmware using SHA256 algorithm. Calculated Hash and firmware signature are put together (for K21 it needs to be sent to CR through AA command) to validate the firmware.
- If firmware is valid (for K21, an ACK response should be received from CR), system starts the preparation sequence for getting into bootloader to write the firmware.
  - Two 4 byte values, total of 8 bytes, of firmware upgrade flag is stored in the designated memory address.
  - Following the last byte of firmware upgrade flag, firmware size is stored into the next 2 bytes of memory address.
  - Firmware Hash is stored to designated memory address for future validation.
  - System reset is generated and system goes into bootloader.
- Bootloader will check the firmware upgrade flag; if correct flag is placed in the designated memory, new firmware stored in the external flash memory will be copied to microcontroller memory where main application is stored and replaces the original firmware.(This step is preceded by sending 4k blocks as download step.)

- After copying is completed, HASH is calculated from the updated firmware and compared to the HASH value stored in the memory in the previous steps. If Hash matches, firmware upgrade flag is cleared from the memory and the image of external flash can be cleared, then system exit bootloader starts for main application.

## 4 ICC EMV Level II Reference Data List

### 4.1 Terminal Data List

Data ID	Tag	Value name	Length (Byte)	Default Value
1	9F1A	Terminal Country Code	2	08 40
2	9F35	Terminal Type	1	25
3	9F33	Terminal Capability	3	E0 F8 C8
4	9F40	Additional Terminal Capability	5	F0 00 F0 A0 01
5	9F1E	IFD Serial Number (write only one time)	8	01 02 03 04 05 06 07 08
6	9F15	Merchant Category Code	2	
7	9F16	Merchant Identifier	15	
8	9F1C	Terminal Identification	8	
9	9F4E	Merchant Name and Location	var.	

Note: IFD Serial Number will be changed from Device Serial Number.

### 4.2 Application Data List

Data ID	Tag	Value name	Length (Byte)	Default Value
1	5F57	Account Type	1	
2	9F01	Acquirer Identifier	6	
	9F06	Application Identifier (AID) – terminal	5-16	
3	9F09	Terminal application version number	2	00 02
4	5F36	Transaction Currency Exponent	1	
5	9F1B	Terminal Floor Limit	4	
6	9F49	Dynamic Data Authentication Data Object List(DDOL)	var. up to 252	
7	97	Transaction Certificate Data Object List(TDOL)	var. up to 252	
8	9F39	POS Entry Mode	1	07
9	9F3C	Transaction Reference Currency Code	2	
10	9F3D	Transaction Reference Currency Exponent	1	
11	99	PIN Block	8	
12	DF10	Terminal Language Preference	8	45 4E (“EN”)
	DF11	Trans Log Support	1	1: enable
13	DF13	TAC-Default	5	
14	DF14	TAC-Denial	5	

15	DF15	TAC-Online	5	
16	DF17	Threshold Value for Biased Random Selection	var	
17	DF18	Target Percentage For Random Transaction Selection	var	
18	DF19	Maximum Target Percentage For Random Transaction Selection	var	
	DF20	Trace	1	
19	DF22	Merchant Forced Transaction Online	1	
20	DF25	Default DDOL	var	
21	DF26	Revocation list Support	1	1: enable
	DF27	Exception list Support	1	0: disable
22	DF28	TDOL	var	
23	DF30	Online DOL	var	
24	DF62	Application Selection Flag	1	
	DF63	Transaction Reference Currency Conversion	4	
25	DF34	Authorization Response Code 1-2 bytes: approved code 3-4 bytes: referral code 5-6 bytes: declined code	6	

#### 4.3 Transaction Data List (start command parameters)

Data ID	Tag	Value name	Length (Byte)	Default Value
1	9F02	Amount, Authorised (Numeric)	6	
2	9C	Transaction Type	1	
3	5F2A	Transaction Currency Code	2	08 40
4	9A	Transaction Date	3	
5	9F21	Transaction Time	3	
6	9F03	Amount, Other(Numeric)	6	
	9F04	Amount, Other(Binary)	6	
	9F3A	Amount, Reference Currenty	4	
	9F41	Transaction Sequence Counter	1	

#### 4.4 Output Data List

Data ID	Tag	Value name	Length (Byte)	Default Value
1	57	Track2 Equivalent Data	<=19	
2	5A	PAN	<=10	

3	5F34	PAN Sequence Number	1	
4	5F20	Cardholder Name	2~26	
5	5F24	Application Expire Date	3	
6	9F20	Track2 Discretionary Data	var.	
7	5F25	Application Effective Date	3	
8	5F2D	Language Preference	2~8	
9	50	Application Label	1~16	
10	84/4F	DF Name or ADF Name	5~16	
11	DF21	Issuer Script Results		

#### 4.5 Option Data List

Data ID	Tag	Value name	Length (Byte)	Default Value
1	9F36	Application Transaction Counter(ATC)	2	
2	9F37	Unpredictable Number	4	
3	9F02	Amount, Authorised(Numeric)	6	
4	9F4D	Log Entry	2

### Byte 3

b 8	b 7	b 6	b 5	b 4	b 3	b 2	b 1	Meaning
0	x	x	x	x	x	x	x	RFU (Revocation of Issuer Public Key Certificate (DF26))
x	1	x	x	x	x	x	x	Manual action when CA PK loading fails
x	x	1	x	x	x	x	x	CA PK verified with check sum
x	x	x	1	x	x	x	x	Bypass PIN Entry
x	x	x	x	1	x	x	x	Subsequent bypass PIN Entry
x	x	x	x	x	1	x	x	Get data for pin try counter
x	x	x	x	x	x	0	x	RFU
x	x	x	x	x	x	x	0	RFU

### Byte 4

b 8	b 7	b 6	b 5	b 4	b 3	b 2	b 1	Meaning
1	x	x	x	x	x	x	x	Amount before CVM processing
x	1	x	x	x	x	x	x	Floor limit checking
x	x	1	x	x	x	x	x	Random transaction selection
x	x	x	1	x	x	x	x	Velocity checking
x	x	x	x	0	x	x	x	RFU (Transaction Log (DF11))
x	x	x	x	x	0	x	x	RFU (Exception File (DF27))
x	x	x	x	x	x	0	x	RFU
x	x	x	x	x	x	x	0	RFU

### Byte 5

b 8	b 7	b 6	b 5	b 4	b 3	b 2	b 1	Meaning
1	x	x	x	x	x	x	X	Terminal action code support

x	1	x	x	x	x	x	x	x	Terminal action code can be change
x	x	1	x	x	x	x	x	x	Terminal action code can be deleted or disable
x	x	x	1	x	x	x	x	x	Default Action code processing before 1st GAC
x	x	x	x	1	x	x	x	x	Default Action code processing after 1st GAC
x	x	x	x	x	1	x	x	x	TAC/IAC default process when unable to go online (Skipped)
x	x	x	x	x	x	1	x	x	TAC/IAC default process when unable to go online (Normal)
x	x	x	x	x	x	x	0	RFU	

**Byte 6**

b 8	b 7	b 6	b 5	b 4	b 3	b 2	b 1	Meaning
1	x	x	x	x	x	x	x	Forced Online support
x	1	x	x	x	x	x	x	Forced acceptance support
x	x	1	x	x	x	x	x	Advices support
x	x	x	1	x	x	x	x	Issuer referrals support
X	x	x	x	1	x	x	x	Batch data capture
x	x	x	x	x	1	x	x	Online data capture
X	x	x	x	x	x	1	x	Default TDOL
X	x	x	x	x	x	x	0	RFU

**Byte 7**

b 8	b 7	b 6	b 5	b 4	b 3	b 2	b 1	Meaning
1	x	x	x	x	x	x	x	amount and pin entered on the same keypad

DFEE1F	<p>Issuer script device limit</p> <p>Range: 0~255 (Default: 128)</p>	b	1																																																						
DFEE20	<p>ICC Power on detect waiting time. (Unit: Sec) (Default: 60S)</p>	b	1																																																						
DFEE21	<p>ICC L1 waiting time. (Unit: Sec)(Default: 10 S)</p>	b	1																																																						
DFEE22	<p>Driver (Menu, Get PIN, Get MSR) Timeout. (Unit: Sec)</p> <p>Byte1: Timeout for Menu. (Default: 30 S)</p> <p>Byte2: Timeout for Get PIN. (Default: 60 S)</p>	b	3																																																						

	Byte3: Timeout for Get MSR. (Default: 60 S)		
DFEE23	MSR Track Data	b	1~768
DFEE24	Force Acceptance (Default: 00)	b	1
DFEF1F	Auto authenticate  Byte1: Auto authenticate if 1. (Default: 1)  Byte2: Force online if Auto auth if 1. (Default 1)	b	2
DFEF20	Response with MAC if 1	b	1

#### 4.7 ID TECH Enhanced TLV format (Masked and Encrypted)

The top 3 bits of the *first length byte* following a tag are used in a special way. The bits are used to indicate masked or encrypted fields (here, we use zero-based bit numbering):

- Bit 7: 1 (ON) means it's necessary to check the next two bits
- Bit 6: 1 (ON) if there is encrypted field
- Bit 5: 1 (ON) if there is masked field

Example:

9F 20 C1 **82** 55 [...]

Tag is 9F20. The length will be given by the one byte after C1, namely 0x82, which has the top two bits set; therefore encryption is used. Data starts with the byte value 0x55.

For more information on the enhanced TLV format, consult document P/N 80000502-001, *ID TECH Encrypted Data Output*.

#### 4.8 Tags with Masked or Encrypted Field

Tag	Data Object	Note
5A	Application PAN	Need masked field and encrypted field.
9F1F	Track 1 Discretionary Data	Encrypted field only.
9F20	Track 2 Discretionary Data	Encrypted field only.
57	Track 2 Equivalent Data	PAN needs to be masked as Tag 5A. Expiry date and service code should be clear-text. Need masked field and encrypted field.
56	Track 1 Data	For MasterCard-Paypass (MagStripe) and DiscoverZip.

		Need masked field and encrypted field.
9F6B	Track 2 Data	For MasterCard-Paypass (MagStripe) only. Need masked field and encrypted field.
9F37	Unpredictable Number	Encrypted field only.
FF EE 13	Track 1 Data	1. DiscoverZip uses it. 2. Visa MSD uses it. 3. Amex uses it. 4. PBOC uses it. Need masked field and encrypted field.
FF EE 14	Track 2 Data	1. DiscoverZip uses it. 2. Visa MSD uses it. 3. Amex uses it. 4. PBOC uses it. Need masked field and encrypted field.

Note:

1. DiscoverZip uses Tag 56, FF EE 13 and FF EE 14.
2. Visa MSD, Amex and PBOC use Tag FF EE 13, FF EE 14.

#### 4.9 Response Code and Transaction Result

No.	Error Result Code	description
1	0x00, 0x00	PROCESS_OFFLINE_APPROVED

## Appendix A: Error Codes

Type	Result byte	Meaning
General	'90','31'	Unknown command
	'90','32'	Wrong parameter (such as the length of the command is incorrect)
	'90','3A'	Number of retries over limit
State error	'90','40'	Invalid Manufacturing system data
	'90','41'	Not authenticated
	'90','42'	Invalid Master DUKPT Key
	'90','43'	Invalid MAC Key
	'90','44'	Reserved for future use
	'90','45'	Reserved for future use
	'90','46'	Invalid DATA DUKPT Key
	'90','47'	Invalid PIN Pairing DUKPT Key
	'90','48'	Invalid DATA Pairing DUKPT Key
	'90','49'	No nonce generated
	'90','4A'	Not ready
	'90','4B'	Not MagAC data
	Data error	'90','50'
'90','51'		Duplicate detected
'90','52'		AT checks failed
'90','53'		TR34 checks failed
'90','54'		TR31 checks failed
'90','55'		MAC checks failed

	'90', '56'	Firmware download failed
Resource error	'90', '60'	Log is full
	'90', '61'	Removal sensor unengaged
	'90', '62'	Any hardware problems
Third party error	'90', '70'	ICC communication timeout
	'90', '71'	ICC data error (such check sum error)
	'90', '72'	Smart Card not powered up
ICC EMV Lv2 error	'F2', '00'	No AID or No Application Data
	'F2', '01'	No Terminal Data
	'F2', '02'	Wrong TLV format
	'F2', '03'	AID list is full, maxim is 16
	'F2', '04'	No any CA Key
	'F2', '05'	No CA Key RID
	'F2', '06'	No CA Key Index
	'F2', '07'	CA Key list is full, maxim is 16
	'F2', '08'	Wrong CA Key hash
	'F2', '09'	Wrong Transaction Command Format
	'F2', '0A'	Unexpected Command
	'F2', '0B'	No CRL
	'F2', '0C'	CRL list is full, maxim is 90

	'F2', '0D'	No amount , other amount and transaction type in Transaction Command
	'F2', '0E'	Wrong CA Hash and Encryption algorithm
	'F2', '0F'	No Financial Card
	'F2', '10'	Invalid CRL length
	'F2', '11'	ICC L2 is not in idle state
	'F2', '12'	Transaction Type Error
	'F2', '13'	Can't modify major bits in terminal setting
	'6C', '00'	Unknown parameter in command – Protocol task ID and command are right but length is out of
	'6A', '00'	Unsupported Command – Protocol and task ID are right but command is invalid
	'60', '00'	Save or Config Failed / Or Read Config Error, Flash Error

## Appendix B: LCD Foreign Language Mapping Table

ID	Message ID	English	French	Spanish	Chinese
